## CLASS XXIV. ORDER I.

## CRYPTOGAMIA FILICES

## TRIBE I. POLYPODIA'CEÆ.

- \*2901. POLYBOTRYA *H. & B.* POLYBOTRYA. (*Polys*, many, *botrys*, raceme; fertile div. of frond.) 2.—6.  
 25309 *cervina* *Kauf.* hart's tongue  $\frac{1}{2}$   $\Delta$  or  $\frac{1}{2}$  ap.my Br Jamaica 1823. D lp Pet. fil. 8. 3  
 25310 *vivipara* *Hook.* viviparous  $\frac{1}{2}$   $\Delta$  or  $\frac{3}{4}$  my.au Br W. Indies 1823. D lp Hook. ex. fl. 107
- \*2902. ACROSTICHUM *L.* ACROSTICHUM. (*Akros*, highest, *stichos*, order; lines on reverse of lvs.) 9.—65
- I. INDIVISA. — *Fronds undivided.*
- 25311 *simplex* *Swz.* simple  $\frac{1}{2}$   $\Delta$  or 1 ... Br Jamaica 1793. D lp Bot. cab. 709  
 25312 *longifolium* *Jac.* long-leaved  $\frac{1}{2}$   $\Delta$  or 1 my.s Br Jamaica 1817. D lp  
 25313 *crinitum* *Swz.* hairy  $\frac{1}{2}$   $\Delta$  or  $\frac{1}{4}$  jl.au Br W. Indies 1793. D lp Pl. fil. 125  
 25314 *glandulosum* *Hook.* glandulous  $\frac{1}{2}$   $\Delta$  or 1 ... Br Jamaica 1825. D lp H. & G. 3.
- II. DIVISA. — *Fronds simple, divided.*
- 25315 *alcicorne* *Swz.* elk's horn  $\frac{1}{2}$   $\Delta$  cu  $\frac{1}{4}$  au.o Br N. S. W. 1808. D sp Bot. reg. 262-3  
 25316 *Stemaria* *Beauv.* Stemaria  $\frac{1}{2}$   $\Delta$  or 1 my.au Br Guinea 1823. D lp Beau. ow. 1. 2
- III. PINNATA. — *Fronds pinnate.*
- 25317 *appendiculatum* *Hook.* appendiculate  $\frac{1}{2}$   $\Delta$  or 1  $\frac{1}{2}$  jn.au Br W. Indies 1824. D lp H. & G. 100  
 25318 *fimbriatum* *H. L.* fringed  $\frac{1}{2}$   $\Delta$  or 1 ... Br Brazil 1824. D lp  
 25319 *aureum* *L.* golden  $\frac{1}{2}$   $\Delta$  or 4 au Br W. Indies 1815. D lp Pl. fil. 104
2903. HEMIONITIS *L.* HEMIONITIS. (*Hemionos*, a mule; supposed to be sterile.) 1.  
 25320 *palmata* *L.* palmate  $\frac{1}{2}$   $\Delta$  el  $\frac{3}{4}$  jn.au Br W. Indies 1793. D lp Hook. ex. fl. 33
- \*2904. GYMNOGRAMMA *Desv.* GYMNOGR. (*Gymnos*, naked, *gramma*, writing; naked sori.) 10.—31.
- I. HIRSU'VE. — *Fronds underneath hairy or scaly.*
- 25321 *pedata* *Kauf.* pedate  $\frac{1}{2}$   $\Delta$  pr  $\frac{1}{2}$  jn.jl Br N. Spain 1822. D lp Swz. fil. 1. 3  
*Hemionitis pedata* *Swz.*  
 25322 *myriophylla* *Swz.* myriad-leaved  $\frac{1}{2}$   $\Delta$  or 1 ... Br Brazil 1824. D lp H. & G. 45  
 25323 *rufa* *Desv.* red-haired  $\frac{1}{2}$   $\Delta$  pr  $\frac{1}{2}$  jn.au Br Jamaica 1793. D lp Schk. fil. 17. 21  
*Hemionitis rufa* *Swz.* *Acrostichum rufum* *L.*
- II. FARIN'OSE. — *Fronds underneath mealy.*
- 25324 *trifoliata* *Desv.* three-leaved  $\frac{1}{2}$   $\Delta$  or 2 jl.au Br Jamaica 1810. D lp Pl. fil. 144  
*Acrostichum trifoliatum* *L.*  
 25325 *chrysophylla* *Kauf.* golden-leaved  $\frac{1}{2}$   $\Delta$  or 1 jl.au Br W. Indies 1824. D lp Pl. fil. 44  
*Acrostichum chrysophyllum* *Swz.*  
 25326 *sulphurea* *Desv.* sulphury  $\frac{1}{2}$   $\Delta$  el 1 jn.jl Br Jamaica 1808. D lp Schk. cryp. 4  
 25327 *tartarea* *Desv.* infernal  $\frac{1}{2}$   $\Delta$  el 1 au Br W. Indies 1817. D lp  
*Hemionitis dealbata* *W.*  
 25328 *peruviana* *Desv.* Peruvian  $\frac{1}{2}$   $\Delta$  or 1 jn.au Br Peru 1822. D lp  
 25329 *calomelanos* *Kauf.* beautiful black  $\frac{1}{2}$   $\Delta$  el 2 jl.au Br W. Indies 1790. D sp W. h. b. 41  
*Acrostichum calomelanos* *L.*
- III. NU'DA. — *Fronds without any hairiness or meanness.*

- 26238 calophylla *Carm.* beautiful thin patches  $\frac{1}{2}$  aut G stones Grev. cryp. 210
3041. ZYGNE'MA *Ag.* ZYGNE'MA. (*Zygos*, yoke, *nema*, filament; filam. jointed together in pairs.) 9. — 21.
- 26239 cruciatum *Ag.* crossed entangl. mass.  $\frac{1}{2}$  ap Y.G ditches Eng. bot. 2463. *C. bipunct.*
- 2 longi-articulatum *Ag.* long-jointed entangl. mass.  $\frac{1}{2}$  ap Y.G ditches Dlw. con. 2. A.
- 3 brevi-articulatum *Ag.* short-joint. entangl. mass.  $\frac{1}{2}$  ap Ysh rivulets Dlw. con. 2. B.
- 26240 decussatum *Ag.* decussate floating tufts  $1\frac{1}{2}$  su G ditches Dlw. con. 39
- 26241 bicolor *Ag.* two-colored floating tufts 3 su G sto. in rivul. Eng. bot. 2288. *Conferva*
- 26242 pectinatum *Ag.* pectinate patches  $1\frac{1}{2}$  mr G rivulets Eng. bot. 2463. B. *Conferv.*
- 26243 curvatum *Ag.* curved patches  $1\frac{1}{2}$  mr G rivulets Eng. bot. 2463. A. *C. strict.*
- 26244 quinulum *Ag.* quinate large masses  $\frac{1}{2}$  sp. su Dl.G still waters Vau. con. 5. 1
- 26245 decimum *Ag.* decimate large masses  $\frac{1}{2}$  su Bt.G still waters Dlw. con. 4. A. B. C. *nitida*
- 26246 nitidum *Ag.* shining float patches 2 su Bt.G ditches Eng. bot. 1656. C. *sparsita*
- 26247 punctatum *Ag.* dotted floating cloud  $\frac{2}{3}$  su Bt.G pools Dlw. con. 51. *Conferva*
3042. MOUGEOTIA *Ag.* MOUGEOTIA. (*J. B. Mougeot*, a cryptogamic botanist.) 2. — 6.
- 26248 genuflexa *Ag.* knee-bent entangl. mass.  $\frac{1}{2}$  ap Y.G ditches Dlw. con. 6. *Conferva*
- 26249 cærulescens *Ag.* cærulescent pale patches  $1\frac{1}{2}$  jl P.B ditches Eng. bot. 2457. *Conferva*
3043. HYDRODICTYON *Ag.* HYDRODICTYON. (*Hydro*, water, *dichtyon*, net; reticulated structure.) 1. — 2.
- 26250 utriculatum *Ag.* purse-like floating web 6 jns G riv. & lakes Eng. bot. 1687. C. *reticul.*
3044. CONFERVA *Ag.* CONFERVA. (*Conferrumino*, to consolidate; close coherence.) 52. — 130.
- i. SIMPLICES. — Filaments simple.
- ii. COLORATÆ. — Floating, cobwebbed, colored.
- 26251 ericetrum *Roth* heath fine web  $\frac{1}{2}$  sp. su Br.P dry bogs Grev. cryp. 261
- 26252 alpina *Bory* alpine fine web 1 sp. su Br mountains Grev. cryp. 261
- 26253 fasciata *Dil.* banded fine web  $\frac{1}{2}$  spring P.Br pit. on carr. Dlw. con. B. *Conferva*
- 26254 bombycina *Ag.* silky floating cloud  $\frac{2}{3}$  su G pools & dit. Dlw. con. 60. C. *sordida*
- ii. VIRIDES. — Floating, cobwebbed, green.
- 26255 floccosa *Ag.* napped float masses  $1\frac{1}{2}$  spring G ditches Eng. bot. 2303. C. *sordida*
- 26256 mucosa *Mert.* mucous float masses  $1\frac{1}{2}$  spring G bogs Dlw. con. B. *Conferva*
- 26257 zonata *W. & M.* zoned long tuft 3 year G sto. in rivul. Dlw. con. 47. C. *lucens*
- 26258 dissiliens *Dil.* bursting floating tufts 3 su G ditches Eng. bot. 2461
- 26259 implexa *Dil.* entangled broad tufts 3 su G sea-shore Eng. bot. 2303. C. *implexa*
- iii. CAPILLARES. — Capillary or setaceous; articulations filled with globose granules, when dry alternately compressed.
- 26260 tumidula *E. B.* tumidish fine film 1 mr G pools Eng. bot. 1670. C. *inflata*
- 26261 vesicata *Ag.* blistered float. masses 6 mr G ditches Eng. bot. 2304. C. *alternat.*
- 2 fuscescens *Ag.* fuscescent float. masses 6 mr G ditches Dlw. con. B.
- 26262 rivularis *L.* rivulet long tufts 24 sp. su G rivers Eng. bot. 1654.
- 2 anglica *Ag.* English long tufts 24 sp. su G ditches Dlw. con. 79
- 26263 capillaris *Ag.* capillary long tufts 3 sp. su G ditches Dl. musc. 5. 25. B
- 26264 linum *Roth* Flax long tufts 3 sp. su G ocean Lyng. hyd. 50
- 26265 intricata *Grev.* matted small tufts  $\frac{1}{2}$  spring G sea shore
- 26266 tortuosa *Dil.* tortuous crisp masses  $\frac{2}{3}$  ap G sea shore Eng. bot. 2220
- 26267 crassa *Ag.* thick crisp masses 1 ap G salt marshes Dlw. con. 9
- 26268 Melagonium *Web.* Melagonium tufts 4 su G ocean Dlw. con. B
- 26269 ærea *Dil.* brazen long tufts 6 year G ocean Dlw. con. 80
- 26270 Youngina *Dil.* Young's minute tufts  $\frac{1}{2}$  su G sea shore Dlw. con. 102
- 26271 hormoides *Lyng.* necklace-like minute tufts  $\frac{1}{2}$  su G sea shore Lyng. hyd. 49
- 26272 collabens *Ag.* slippery floating tufts 4 su G Germ. ocean Eng. bot. 1929. C. *ærea*
- 26273 flacca *Dil.* flaccid tufts 2 year G on Hutchina Dlw. con. 49
- 26274 isogona *E. B.* equal-jointed float. patches 1 spring G on F vesicul. Eng. bot. 1580. C. *Young.*
- 26275 fucrum *Roth* Fucus tufts  $\frac{1}{2}$  su Brsh on Fuci Dlw. con. C. C. *flaccida*
- 26276 flaccida *Lyng.* drooping tufts  $\frac{1}{2}$  my Brsh on Fuci Eng. bot. 9310

- 92277 *ferruginea Roth* rusty tufts 1 year Rus. on Fuci Diw. con. 66. *C. fuscula*
- 92278 *curta Dal.* short minute tufts 1 year O.Br. on Fuci Diw. con. 76
- 92279 *carnea Dal.* tufts ½ aut. Pa. on Algae Diw. con. 84
- II. RAMULÆ. — Filaments branched.
- 92280 *viruginosa Hud.* verdigrise tufts 1½ su B.L.G. sea shore Diw. con. E.
- 92281 *Brownii Dal.* Brown's patches ½ spring G. Irish caverns Diw. con. D.
- 92282 *stellaria Fl. dan.* starry floating tufts 2 su G. in. of wa. ves. Fl. dan. 640 I.
- 92283 *ruparia Dal.* bank floating tufts 3 su G. salt ditches Eng. bot. 2300
- 92284 *glomerata L.* clustered bushy tufts 1 su B.L.G. riv. on stones Eng. bot. 1854 *C. latvica*
- 92285 *crispata Roth* curled patches 2 sp. su G. lakes Eng. bot. 2330
- 92286 *fracta Dal.* broken large tufts 6 sp. su G. pools Eng. bot. 2338
- 92287 *patens Ag.* spreading large tufts ½ su G. ditches Diw. con. 10. *C. ferriana*
- 92288 *prolifera Ag.* proliferous large tufts ½ su G. ditches Diw. con. 10. *C. ferriana*
- III. CUMULATA. — Filaments branched and heaped.
- 92289 *congregata Ag.* heaped tufts 1 su G. roc. sea coast Lyng. hyd. 56. *C. canaliculata*
- 92290 *lanosa Ag.* woolly tufts 1 su G. on Algae Diw. con. E.
- 92291 *flavescens Dal.* flavescens tufts 6 su Y.O. salt ditches Eng. bot. 2088
- 92292 *sericea Hud.* silken shining tufts 3 su Y.G. sea shore
- 92293 *refracta Roth* broken crispent tufts 4 jn. jl. Pa. G. ocean Eng. bot. 2327. *C. albidula*
- 92294 *aspera Ag.* rough tufts 3 year G. ocean Diw. con. E. *C. nigricans*
- 92295 *heterochloa Ag.* various gram tufts ½ year D.G. ocean
- 92296 *rupestrus L.* rock dense tufts 4 su G.I. ocean Eng. bot. 1629
- 92297 *agagropila L.* wild goat balls soft ball 3 su G. lakes Eng. bot. 1377
- 92298 *arcta E. B.* close floating tuft 3 su Tran. ocean Eng. bot. 2098
- 92299 *vaucheriaeformis Ag.* Vaucheria-lik branched 1½ su G. ocean Diw. con. E. *C. arcta*
- 92300 *cautelata L.* chain-like patches 1 su Br. ocean Di. muse. 5. 27
- 92301 *Hutchinsonii Dal.* Miss Hutchinson's dense tufts 4 su G.I. ocean Diw. con. 119
- 92302 *pellucida Hud.* pellucid finely branch. 5 su Pa. G. ocean Eng. bot. 1716
- 92303 *distans Ag.* distant loose bundles 6 aut. Pa. G. ocean Diw. con. 21. *C. diffusa*
- 92304 *BULBOCHÆTE Ag.* BULBOCHÆTE. (*Bulbos*, bulb, *chaete*, bristle; primary filaments.) I.
- 92305 *setigera Ag.* setigerous delicate tufts 6 aut. D.I. G. lakes & riv. Diw. con. 59. *C. crispata*
- 92306 *NITELLA Ag.* NITELLA. (*Nitelo*, to shine; shining plants.) 5.—11.
- 92307 *transluens Ag.* transparent branched 12 su Y.O.I. pools Eng. bot. 1855 *Chiron*
- 92308 *flexilis L.* flexible branched 12 su Y.O.I. pon. & rivul. Eng. bot. 1703. *Chiron*
- 92309 *Chiron flexilis L.* Eng. bot. 2140. *Chiron*
- 92310 *opaca Ag.* opaque branched 12 j. su Y.O.I. pools Eng. bot. 1703. *Chiron*
- 92311 *indifica Ag.* nest-making branched 12 j. su Y.O.I. pools Eng. bot. 2140. *Chiron*
- 92312 *gracilis Ag.* slender much branched. 6 su Y.O.I. pools Eng. bot. 2140. *Chiron*
- 92313 *CHAËRA L.* CHAËRA. (*Chairo*, to delight; delights in water.) 3.—16
- 92314 *hispidula L.* hispid branched 9 j. su Y.G. ponds Eng. bot. 465
- 92315 *vulgaris L.* common branched 12 j. su Y.G. ponds Eng. bot. 336
- 92316 *læpa W.* rough branched 5 su Y.G. lakes Grer. cryp. 339
- 92317 *CERAMIUM Ag.* CERAMIUM. (*Keramion*, a pitcher; appearance of capsules.) 23.—38.
- I. FASTIGIATA. — Filaments short, fastigiate.
- 92318 *lanuginosum Ag.* woolly fine down ½ year Br. on Algae Diw. con. 45. *Conferva*
- 92319 *floridulum Ag.* flowering little tufts ½ year Pa. G. roc. sea shore Diw. con. F.
- 92320 *repens Ag.* creeping short down ½ j. su Pk. on large Algae Eng. bot. 1708. *Conferva*
- 92321 *piluma Ag.* feather fine tufts ½ su R. on large Algae Diw. con. F.
- 92322 *Daviesii Ag.* Davies's small tufts ½ j. su R. sea shore Eng. bot. 2329
- 92323 *Rothii Ag.* Roth's broad tufts ½ su V. sea shore, roc. Eng. bot. 1702
- II. DICHOÏOMA. — Filaments dichotomous; branchlets forked; joints obscure; theca imbricated.
- 92324 *diaphanum Ag.* diaphanous diffuse 5 su Va. ocean Eng. bot. 1742
- 92325 *pilosum Ag.* pilose diffuse 5 su Va. ocean Eng. bot. 2428. *Conferva*
- 92326 *rubrum Ag.* red solitary weak 10 su P. ocean Eng. bot. 1165. *Conferva*
- III. RAMBDA. — Branches furnished with branchlets, which are more or less dense and shortened.
- 92327 *tetragynum Ag.* square tufts 3 su R. ocean Eng. bot. 1690
- 92328 *pedicellatum Ag.* stalked dense tufts 4 su O. sea shore Diw. con. 108
- 92329 *Hookeri Ag.* Hooker's fine tufts 1½ su Pa. br. sea shore Diw. con. 106
- 92330 *patens Grer.* spreading solitary? 3 spring F.I. R. sea Grer. cryp. 318
- 92331 *arbuscula Ag.* little tree bushy tufts 3 year D.R. sea shore Eng. bot. 1916
- IV. ALTERNATA. — Branches pinnulate; pinnule alternate.
- 92332 *corymbosum Ag.* corymbose little tufts 1½ j. su R. sea shore Eng. bot. 2552
- 92333 *pinnulatum Ag.* pinnulate tufts 2 ... R. sea Diw. con. 17
- 92334 *roseum Ag.* rosy finely branch. 1½ j. su R. ocean Eng. bot. 2465. *C. purpurina*
- 92335 *rhujoides Ag.* Arbor-Vitæ-lik finely branch. 6 j. su R. ocean Eng. bot. 966. *C. rosacea*
- 92336 *versicolor Ag.* various-colored fine tufts 3 su P.R. on Fuci Eng. bot. 1741
- 92337 *Borreri Ag.* Borrer's little patches 1½ o. O.R. ocean Eng. bot. 1915
- 92338 *tétricum Ag.* rough tufts 6 spring D.I. P. sea shore Eng. bot. 1838
- 92339 *interruptum Ag.* interrupted little tufts ½ j. su D.I. P. sea shore Eng. bot. 1838
- V. OPPOSITA. — Filaments pinnate; pinnæ opposite.
- 92340 *Türneri Ag.* Turner's delicate bran. 2 sp. su Pk. sea shore Eng. bot. 2339.
- 92341 *pilumula Ag.* feather-like delicate bran. 2 sp. su Pk. sea shore Eng. bot. 1637. *C. Turneri*
- 92342 *GRIFFITHSIA Ag.* GRIFFITHSIA. (*Mrs. Griffiths*, of Devonshire.) 5.—7.
- 92343 *multifida Ag.* many-cleft fine tufts 3 j. su R. sea shore Eng. bot. 1816. *Conferva*
- 92344 *equisetifolia Ag.* Equisetum-lik. sponge-lik. tu. 6 su R. sea shore Eng. bot. 1479
- 92345 *setacea Ag.* bristly lax tufts 4 year R. sea shore Eng. bot. 1789
- 92346 *barbata Ag.* bearded flocculent 1½ j. su C. sea shore Eng. bot. 1814
- 92347 *corallina Ag.* coralline branch. tufts 3 j. su O.R. sea shore Eng. bot. 1815
- 92348 *CHÆTOSPORA Ag.* CHÆTOSPORA. (*Chaete*, bristle, *spora*, seed; on fine divisions.) I.
- 92349 *Wiggii Ag.* Wigg's finely branch. 5 su R.Br. sea shore Eng. bot. 1165. *Fucus*
- 92350 *POLYSIPHONIA Grer.* POLYSIPHONIA. (*Polys*, many, *siphon*, tube; tubes for color.) 18.—49.
- I. SUBPINKATE. — Purple or scarlet, flat, somewhat pinnated.
- 92351 *parasitica Grer.* parasitical small patches 1½ su R.Br. on Fuci Eng. bot. 1429. *Conferva*
- 92352 *spinulosa Grer.* parasitical spiny-stem small patches 1½ su R.Br. sea shore Grer. cryp. 90
- 92353 *coccinea Grer.* scarlet bushy tufts 4 year S. ocean Eng. bot. 1055. *Conferva*

II. SECUNDARIA<sup>REA</sup>. — *Creeping; branches divaricating, often one-sided.*

 26745 *spuria E. B.* spurious lobed frond 1½ jl Ol. Br thatch Eng. bot. 1542  
 26746 *polydactyla Ach.* many-fingered smooth-hood 1½ jl Gl on the earth Jac. c. 14. 2.
3099. **NEPHROMA Ach.** NEPHROMA. (*Nephros, a kidney; form of apothecia.*) 2. — 8.  
 26747 *resupinata Ach.* resupinate short-lobed 3 year Gy. Br among moss Eng. bot. 305  
 26748 *parilis Ach.* equal foliaceous 3 year Br stone quarr. Eng. bot. 2360
3100. **ROCC'ELLA Ach.** ORCHALL. (*Roccha, a rock, Port.; place of growth.*) 2. — 7.  
 26749 *tinctoria Ach.* true dyer's bushy tufts 1½ year Y. Br marit.-rocks Eng. bot. 211  
 26750 *uciformis Ach.* Fucus-formed bushy tufts 4 year Gl granite rocks Eng. bot. 728
3101. **EVERNIA Ach.** EVERNIA. (*Euernes, well branched; bushy plants.*) 1. — 6.  
 26751 *Prunastri Ach.* Prunaster multif. segm. 2 year G. W trees Eng. bot. 859  
 Lichen stictóceros Eng. bot. 1353.
3102. **CENOMYCE Ach.** CENOMYCE. (*Kenos, empty, mykes, fungus; hollow receptacle.*) 20. — 43.  
 I. Pycnothelia. — *Thallus subcrustaceous, uniform; podetia hollow.*  
 26752 *capillaria Ach.* pimples granul. crust ½ winter Gysh damp earth Eng. bot. 907  
 II. Scyphophore. — *Thallus foliaceous; podetia fistular, dilated upwards and fertile, or sterile and subulate; apothecia closed with a membrane.*  
 i. Fu'scia. — *Apothecia fuscous or pallid.*  
 26753 *alcicornis Ach.* elkhorn tufts ½ winter G heaths Eng. bot. 1392  
 26754 *andivivifolia Ach.* Endive-ld multifid tufts ¾ winter Y. G dry places Eng. bot. 2361  
 26755 *cervicornis Ach.* Stag's-horn multifid tufts 1½ winter Gl rocky heaths Eng. bot. 2374  
 26756 *pyxidata Ach.* box-like tufts ¾ spring Gl banks Eng. bot. 1333  
 26757 *himbriata Ach.* fringed coralloid tufts 1½ spring Gl moors & hea. Eng. bot. 2438  
 2 radiata Ach. radiated coralloid tufts 2 spring Gl on the grou. Eng. bot. 1835  
 3 cornuta Ach. horned coralloid tufts 1½ spring Gl moors & hea. Eng. bot. 1836  
 26758 *gonorega Ach.* cushion-sprouting tufts 1 su Cin mountains Eng. bot. 1867  
 2 anomala Ach. dissimilar brittle tufts 1 spring Cin hills Eng. bot. 1867  
 26759 *emocyna Ach.* imitative fine tufts ¾ spring Gy hea. & moun. Eng. bot. 1284  
 2 gracilis Ach. slender fine tufts ¾ spring Gy hea. & moun. Eng. bot. 1284  
 ii. Coccy'neæ. — *Apothecia scarlet or dark red.*  
 26760 *bacillaris Ach.* rod-like branched 2 year Wra woods Eng. bot. 2028. L. filifor  
 26761 *digitata Ach.* fingered powdery 1½ year Y. G woods Eng. bot. 2439  
 26762 *deformis Ach.* deformed branch. tufts 3 year Su roots of trees Eng. bot. 1334  
 26763 *coccifera Ach.* berry-bearing long tufts 3 winter Gy. G moors & hea. Eng. bot. 2051  
 2 cornucopioides Ach. cornucopia-lik short tufts 1½ winter Gy. G moors & hea.  
 26764 *bellidiifera Ach.* Daisy-flwd stiff scaly 2 winter Pale lofty moun. Eng. bot. 1894
- III. Schasma'ria. — *Thallus foliaceous; podetia fistular, dilated upwards, and fertile; apothecia perivious.*  
 26765 *sparassa Ach.* torn branch. tufts 2 year Yr G in woods Eng. bot. 273
- IV. Helopodia. — *Thallus foliaceous; podetia somewhat fistular, cylindrical, simple, split at end or digitate; rays all fertile.*  
 26766 *delicata Ach.* delicate mealy patch ½ winter G rotten rails Eng. bot. 2052
- V. Cladonia. — *Thallus foliaceous, scarcely any; podetia cartilaginous, rigid, fistular, all tapering subulate branched; axille generally bored through.*  
 26767 *racemosa Ach.* racemose loosely bran. 1½ year Gsh heaths Di. musc. 16. 25  
 26768 *furecata Ach.* r-cked smooth tufts 2½ year Ld. br woods Di. musc. 16. 27. A. D.  
 2 subulata Ach. subulate slightly bran. 2 year Ld. br woods Di. musc. 16. 21. A. B.  
 26769 *uncialis Ach.* inch rigid smooth 1½ winter Pa. G moors Eng. bot. 174  
 26770 *rangiferina Ach.* rein-deer much bran. 2 year Hoa woods Eng. bot. 277  
 2 pungens Ach. pungent branched tuft 2 year Gy commons Eng. bot. 2444
- VI. Cera'nia. — *Thallus none; podetia soft, subsolid, subulate, somewhat branched; axille not bored through.*  
 26771 *vermicularis Ach.* vermicular little tufts 1 su W high mount. Eng. bot. 2029

# SUPPLEMENT.

To save unnecessary reference from the body of the work to this Supplement, and at the same time to indicate when a reference to it is necessary, an asterisk (\*) is placed in the body of the work before such of the genera as are divided or repeated here, and also in those places where new genera should have come in. Those genera or species in this Supplement, which are merely alterations of the names, or distribution in the Natural System, of genera or species in the body of the work, are distinguished by a section (§). The same mark, in the body of the work, indicates that the name, or its place in the Natural System, is altered in the Supplement.

## PART II.

### NATURAL ARRANGEMENT.

#### EXPLANATORY INTRODUCTION.

**T**HE species under the different Classes, Orders, and Tribes, are enumerated with reference to their garden culture, and the totals given under each of the principal Subdivisions, Orders, and Tribes. The space of ground which the hardy plants of the different orders would occupy is estimated with a view to the formation of arboretums and herbaceous grounds, arranged according to the Natural System. In the latter estimation the following rules have been adhered to:—The rootless Cryptogamia, such as *Músci*, *Hepáticæ*, &c., have not been included. All climbers, whether ligneous or herbaceous, have been allowed a square of two feet on the side. All other hardy plants, whether ligneous, herbaceous, or aquatic, under one foot in height, have been allowed a square of one foot on the side; all of one foot and under two feet, a square of two feet on the side; all of two feet and under six feet, a square of three feet on the side; all of six feet and up to thirty feet, a square of ten feet on the side; all above thirty feet, a square of twenty feet on the side. Supposing it intended to estimate, according to these rules, the space which the hardy herbaceous plants of any tribe or order would occupy; then the first thing is to find the space allowed for each species or variety separately, by multiplying the side of the square allowed to each species or variety by itself; the next thing is to add the products of the multipliers of each separate species or variety together; and the last process is to take the square root of the total so obtained. This root gives the side of a square which would contain all the smaller squares, and consequently the size of a square bed or compartment which would contain all the hardy herbaceous plants of the tribe or order. Every gardener knows, or ought to know, how to modify this square to a parallelogram, a triangle, or a circle, of the same capacity.

The same process has of course been followed in estimating the size of the compartments requisite for each of the orders and tribes of the hardy ligneous plants. The same also in ascertaining the sides of the squares that will contain all the orders in a subclass; all the subclasses in a subdivision; all the subdivisions in a class; and all the classes in the two grand divisions of the system: or, in other words, of a square which will contain all the plants which will endure the open air in Great Britain.

In estimating the space requisite for every individual plant, the dimensions allowed may be taken indifferently as the side of a square, or the diameter of a circle: since the extremities of the horizontal branches or of the leaves of every plant may be said to form the circumference of a circle, of which its stem is the centre; and since in practice to place together any number of circular beds, is to place together the same number of squares, the side of each of which is equal to the diameter of each of the circles. But it is evident that a large circular bed of any given diameter will not contain so many smaller circles or squares, as a large square whose side is equal to the diameter of the large circle; the latter being contained within the former; and hence it is necessary, in adopting the circular form for any compartment which is intended to contain more than one plant, always to add to the side of the square one eighth of its length, as the diameter of an equivalent circle. Thus the side of a square which would contain the order *Magnoliacæ* is sixty-two feet; but a circle to contain the same number of plants, with the same room to each, will require a diameter of seventy feet, or eight feet more than the side of the square. One eighth part is not quite sufficient; but it is near enough for practice; one seventh would be too much.

In indicating the results of these calculations, to save room, a tree (♣) is substituted for the words, *Hardy Ligneous Plants*; an herb (☞) for the words, *Hardy Herbaceous Plants*; and a water plant (♣), for *Hardy Water Plants*.

The utility of these calculations to gardeners, in designing arboretums or herbaceous grounds, will be very considerable; since it will enable them to proportion the size of every bed, group, or clump, to the hardy plants which can be got to fill it. It will also enable those who wish to form small arboretums or herbaceous grounds, to diminish the size of their groups in due proportion; so as that their arrangement, however small, may exhibit not only a specimen of the plants of every group, but by its size, relatively to the other groups, convey an idea of the proportion of the plants fitted for temperate latitudes which that group contains.

In general, it may be observed, that the best mode of laying out an herbaceous arrangement according to the Natural System is by circular groups, on a plane, or on a regularly convex or concave surface, with a circular boundary; the space between the groups being covered with grass, gravel, or pavement. We should prefer gravel, each group being edged by box; because grass is unfavourable to walking on in moist weather, and pavement, though cheapest in the end, is expensive at first. To arrange the groups systematically on this surface, and at the same time to throw the numerous circles into agreeable figures, the following mode may be adopted:—Take three or four sheets of common letter paper; three or four sheets colored black on both sides; three or four red; three or four green; three or four yellow; and three or four blue. Then fix on a certain scale, say one foot to one eighth of an inch, being the common division of pocket rules, and with a pair of compasses draw circles representing all the orders of *Thalamifloræ* on the white paper; of the next subclass on the black paper; and of the third on the red paper; *Monochlamydææ* on the green paper; *Monocotyledonææ* on the yellow paper; and the garden plants of *Foliacææ* on the blue paper. Next write the name and number of the order or tribe on each circle. Cut out all the circles, keeping each color by itself, and stick on the circles representing tribes on the large circle representing the order to which they belong. Now paste several large sheets of paper together, so as to form a surface of the size and shape of the intended arboretum or herbaceous ground, adopting the same scale as for the circles. Then take all the orders belonging to one color, and arrange them in a figure, agreeable in point of effect, and correct with reference to the affinities of the orders. The same as to the other colors. You have thus before you all the beds of the flower-garden or herbaceous ground. After varying them in a great many ways, and having at last made a satisfactory disposition, fix each circle in its place on the large paper with gum or paste, and the result is the working plan.

The same method of trial and correction will be found among the best for arranging a *Systèma Naturæ* as a flower-garden on a lawn, or on any piece of ground of irregular shape in the pleasure-ground; and it may also be employed when the whole of the trees and shrubs in the park and pleasure-grounds of a residence are to be planted in the order of nature. In the two latter cases, when the circles are all in their places, and it is thought desirable to form irregular shapes, for the proper size and connection of such shapes the separate circles are excellent indications. In laying out herbaceous arrangements, the circles of tribes belonging to the same order, and sometimes of orders, may be joined together by bends, which in the execution on the ground may be made six or eight inches wide. These bends, judiciously contrived, will aid in giving effect to the general figure, as well as prove useful helps to the student in a scientific point of view.

One of the most generally applicable methods of planting an arboretum is that of placing the trees and shrubs along one or both sides of a winding shrubby walk; placing no tree or shrub nearer the walk, or nearer another tree or shrub, than half its own height. A complete arboretum on this plan would extend along at least two miles of walk; a complete herbaceous ground, as will be seen by the estimate, would occupy an acre and one third: but all the orders and tribes both of hardy ligneous and herbaceous plants may be

exemplified in less than a tenth of these spaces. In a work which will shortly appear\*, will be found a variety of plans for herbaceous grounds and arboreetums composed in the manner described, and for planting all the grounds of a residence according to the Natural System.

The enumeration of the species under the different garden divisions of hardy, herbaceous, &c., and under the botanic divisions of orders, tribes, &c. is of important and varied use and interest, in respect to garden culture, vegetable geography, and the formation of herbariums and collections of figures of plants; but this we presume to be so obvious to every gardener and botanist as not to require explanation.

THE difficulties connected with the adoption of the Natural System of plants are these, — that the characters of many of the orders are at present imperfectly known, and that they all depend upon a consideration of many points of structure which are not to be determined without much labour and a considerable degree of practical skill in the use of the microscope and the dissecting knife. But the facilities which the habit of viewing natural bodies with reference to the relations they bear to other bodies, and not as insulated individuals merely possessing certain peculiarities by which they may be referred to some station in an artificial system, ultimately gives to the investigations of the naturalist, are so great, that difficulties of the nature just alluded to should not be suffered to influence the botanist in determining which line of study he will follow, whether that pointed out by Linnæus, or that traced by the hand of nature. By the artificial system of Linnæus, indeed, no great difficulty exists in determining the number of stamens or styles possessed by a given plant, or the nature of their combination, and from the knowledge so obtained, in referring them to their class and order in the Linnean system. But when this step has been gained, what more has been acquired than the bare knowledge that the plant in question possesses a certain number of stamens and styles? No possible notion can be formed of the relation it bears to other plants of the same nature, of the qualities it probably possesses, or of the structure of those parts not under examination — the fruit for example; and, finally, if it were wished to convey an idea of the plant to a stranger, no means would be in the possession of the Linnean botanist of doing so, except by stating that the plant belonged to Pentándria Monogýnia for example, which is stating nothing. But what would be the condition of the student of the natural affinities of plants in a similar case? It is true he would be obliged to consult more characters than the two unimportant ones of Linnæus: it would be necessary to ascertain if his subject was Vascular or Cellular; if Vascular, whether it was Monocotyledonous or Dicotyledonous; if Dicotyledonous, whether the leaves were opposite or alternate, stipulate or exstipulate, whether the flowers were monopetalous, polypetalous, or apetalous, the nature and station of the stamens, the condition of the ovarium, and so on. But when he has ascertained thus much, only let it be remembered, for a moment, how much he has gained indirectly as well as directly.

\* Illustrations of Landscape-Gardening and Garden Architecture, by various Artists in different Countries of Europe, and in North America. Edited by J. C. Loudon. In Imperial folio parts quarterly, 5s. each.

Perhaps he has discovered that his plant belongs to Rubiææ; he will then have learned that all vegetables with opposite entire stipulate leaves, and a monopetalous superior corolla, are also Rubiaceæ. If a fragment of the leaves and stem only of such a plant were afterwards submitted to him for examination, he would recognise its affinities, and remember that it was Rubiaceæ, and, being aware of that fact, he would be able safely to infer that its calyx and corolla would be of a particular nature; that if the roots afforded any color for dying, it would be red; that the medicinal properties of the bark, if any, would be tonic, astringent, and febrifugal; and that its seeds would be of the same nature as those of coffee; and, finally, its geographical position would be tolerably certain to him.

The principal difficulty which has to be encountered by the student of the Natural System of plants is caused by the want of an introduction to the subject, accompanied by the characters of the several orders; this is indeed removed as far as the British Flora is concerned by the publication of Mr. Lindley's *Synopsis*, in which the essential characters of all the wild flowering plants of this country are stated and analysed; but it still exists with respect to the vegetable kingdom in general. It is obviously impossible to overcome this difficulty here; all that we can do is to point out the characters of the great divisions under which the orders are arranged; even this necessarily very imperfect mode of treating the subject will probably remove some of the inconvenience that is at present experienced.

Plants considered with reference to their general structure, are separated into two grand divisions called CELLULARES and VASCULARES.

The Cellulæres answer to the Linnean Cryptogamia, and are also called Acotyledonæ; the Vasculæres answer to the rest of the Linnean system, which is sometimes called Phanerogamia and Cotyledonæ.

CELLULARES, CRYPTOGAMOUS, or ACOTYLEDONOUS, plants are all, therefore, different terms denoting the same combination of vegetables. The first term is here adopted in preference to the others as expressing the most obvious character upon which the division depends, namely, the cellular, not vascular, structure of the plants composing it. Cellular plants are formed entirely of cellular tissue (fig. 1.), without spiral vessels; or in

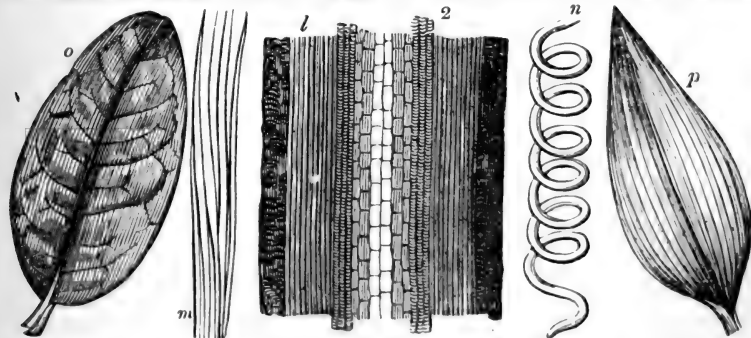

a, Longitudinal section of a stem.  
 b, Transverse section of a stem.  
 c, Stem of a moss, with leaves and theca, or seed-case.  
 d, Leaf of a moss magnified.  
 e, Leafy thallus of a lichen, with shields.

f, Crustaceous thallus of a lichen, with shields.  
 g, Fungi of the highest dignity.  
 h, i, Fungi of the lowest rank.  
 k, Conferva magnified.

more familiar terms by having no veins in their leaves if foliaceous, and not forming wood; they also are destitute of perfect flowers. The lower tribes, such as Fungi and Algæ, are destitute of leaves, and in some points approach the animal kingdom so nearly as to be scarcely distinguishable. In the highest tribe, Ferns, apparent veins are formed in the leaves; but as they are not supplied with spiral vessels, they cannot be considered more than analogous to the veins of other plants. Ferns, however, hold the intermediate station between Cellulæres and Vasculæres, and are chiefly retained among the former on account of their perfect accordance in other respects. In the whole of Acotyledons, it is unnecessary to examine the seed for the purpose of determining whether it has one cotyledon, several cotyledons, or none, the structure of the perfect plant giving the most obvious and satisfactory evidence.

VASCULARES, PHENOGAMOUS, or COTYLEDONOUS, plants, are also separated into two great classes called Endógenes or Monocotyledons, and Exógenes or Dicotyledons, both which are distinguished as accurately by their obvious physical structure as they are by the minute and obscure peculiarities of the seed. They are all formed with cellular tissue, woody fibre, and spiral vessels (fig. 2.), and their leaves are traversed by veins; the last character is sufficient for practical purposes, if it is remembered that they also bear perfect flowers,

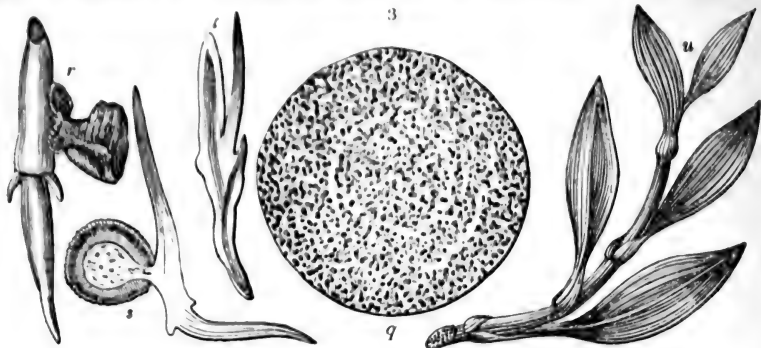

l, Vertical section of a vascular stem.  
 m, Woody fibre, or elongated cellular tissue.  
 n, Spiral vessel.

o, Leaf of a dicotyledonous plant.  
 p, Leaf of a monocotyledonous plant.

(that is, flowers furnished either with stamina, or pistillum, or both), which will always prevent their being confounded with the highest tribes of Cellulæres.

*Endógenes*, or *Monocotyledonous* plants, are the first remove from Cellulæres, and hold an intermediate rank between them and *Exógenes* or *Dicotyledonous* plants, in which vegetation acquires its highest form of development. They were formerly characterised by having a single cotyledon, but this circumstance is not only not absolute, but difficult of determination, except after minute analysis. The real difference in the seed of them and *Dicotyledons* is this, that in *Monocotyledons* there is only one cotyledon (fig. 3. a); or, if two, that

q, Transverse section of a monocotyledonous stem.  
 r, Germination of a monocotyledonous seed.  
 s, Section of ditto, to show the cotyledon remaining in the testa.

t, Section of a germinating embryo of a grass, to show the two alternate cotyledons of unequal size; the back and front lobes represent these, the middle lobe is the plumula.  
 u, Stem and leaves of a monocotyledonous plant.

they are alternate with each other (t), while in *Dicotyledons* they are always opposite, and more than one, sometimes several, as in *Pinus* (fig. 4. y). The physiological structure of the two classes is, however, that by which they are familiarly distinguished, and exhibits a beautiful proof of the harmony that exists between the great features of vegetation and their first principle, the seed from which they originate. In *Endógenes*, or *Monocotyledons*, there is no distinction between wood and bark (fig. 3. q); in *Exógenes*, or *Dicotyledons*, the wood and bark are distinctly separated (fig. 4. v). In *Monocotyledons* the wood and cellular tissue are mixed together without any distinct annual layers of the former being evident; in *Dicotyledons* the wood and cellular tissue have each their particular limits assigned them, a distinct layer of the former being annually deposited. In *Monocotyledons* there are no radiations from the medulla to the bark; in *Dicotyledons* the radiations are distinctly marked. In *Monocotyledons* there is generally no articulation between the leaves and the stem, while in *Dicotyledons* the leaves are always jointed with the stem, from which they fall off, leaving a scar behind. In *Monocotyledons* the veins of the leaf pass in parallel lines from the base to the apex, in *Dicotyledons* they diverge from the midrib towards the margin at various angles; in the former they are unbranched, the principal veins being connected by nearly simple secondary veins; in the latter they are much branched, ramifying in many directions, and giving the surface of the leaf a netted appearance.

v, Transverse section of a dicotyledonous stem  
 w, An embryo with two cotyledons.  
 x, An embryo with four cotyledons.

y, An embryo with many cotyledons.  
 z, Stem and leaves of a dicotyledonous plant.

Such are the very obvious distinctions of the two great classes of phanogamous, or flowering, plants; and so far is it from there being any necessity for dissecting a seed in order to ascertain its structure, that this point is one of the most easy determination, and about which there cannot be in one case in five hundred the slightest cause of doubt or difficulty. It is almost impossible to see even a morsel of a plant without instantly being in possession of the knowledge of the structure of its seed, with respect to the cotyledons.

Thus far have we advanced without a single obstacle to impede us. In all farther investigation no greater degree of knowledge or application is requisite than what ought to be possessed by every one who would be able to ascertain the genus of a plant. Many of the orders do not depend upon the minute characters of the seed so much as is believed; the structure of the ovarium and position of the ovula are aids which frequently make amends for the absence of fruit; and the nature of the foliage and inflorescence is a guide which, though sometimes treacherous, is often as faithful as the fructification itself. But as it is not intended to give the characters of the orders in this place, neither is it necessary to advance further in an explanation of the manner of determining them; upon that point each order would require a particular note. It may, however, be confidently believed, that there are no greater impediments in the road to an acquaintance with the natural relations of plants than those that have been already removed; and that although neither the science

of botany, nor any other science, is to be taken by storm, yet that the fortress is sure to be reduced by silent and patient approach.

It only remains to explain briefly upon what principles the names of the orders, suborders, &c., are formed. It is usual, in the school of Jussieu, to give a natural order a name derived from that of the genus which is understood to be the type of the order; as Ranunculaceæ from *Ranunculus*, Rosaceæ from *Rosa*, and so on. But several deviations from this principle had been admitted by Jussieu, in favour of certain groups of plants, long known by other popular names, derived from certain peculiarities; such as Labiæ, because their corollas are labiate; Compositæ, because their flowers are what is commonly called compound; Guttifera, on account of the resinous juice in which they abound, and some others. It would, perhaps, have been better, if uniformity in nomenclature had not thus been sacrificed to a dread of innovation; but it is now too late to remedy the evil, if such it be; nor would the advantage of alteration be at this day equivalent to the inconvenience. For the purpose of making it at once apparent, whether, in speaking of a group of plants, reference is had to an order or a suborder, it has of late years been thought convenient to terminate the name of the natural order in *aceæ*, and of the suborder in *ææ*. Thus, in speaking of the whole mass of which *Ranunculus* is the representative, the word *Ranunculaceæ* is used; but in speaking of the particular division, or suborder, of which *Ranunculus* forms a part, the term *Ranunculææ* is employed. This manner of speaking is, however, at present, very partial in its application, and is of little importance, except in a few cases, of which *Ranunculææ* is one of the most striking examples. In those orders, the titles of which, necessarily, from their grammatical construction, end in *ææ*, as *Orchidææ*, it is obviously inapplicable, without a total change in a great part of the nomenclature of natural orders, a measure which cannot be too much deprecated.

It may, perhaps, be finally expected, that these remarks should be concluded by a recommendation of some work, from which those who are anxious to become fully acquainted with the principles and distinguishing characters of the Natural System of Botany, may derive the necessary information. Unfortunately, however, such a work has at present no existence. M. Decandolle's *Théorie Élémentaire de la Botanique* explains the principles upon which the orders of plants are constituted; and M. de Jussieu's *Généra Plantarum* contains their characters, as determined in 1789: but the latter is now too obsolete to be very useful to the tyro. In our own language, the best work to consult is the *Synopsis of the British Flora* by Mr. Lindley. We understand a more extensive work upon the subject is in preparation by the latter gentleman, by which this great desideratum in the science of Botany will be supplied. It may be expected to appear in the course of 1830, previously to which, however, the reader may consult Richard's *New Elements of Botany*, which contains translations of Jussieu's Natural Orders; or he may refer to the *Dictionnaire des Sciences Naturelles*.

In the list of genera under each order, in the following arrangement, the figures in the first column indicate the place, in the former part of the work, of the genus to which they are prefixed; those in the second column of figures show the number of hardy ligneous species and varieties, and those in the third, that of hardy herbaceous species and varieties, belonging to the genus which they follow. Where a genus includes native British species, a star (\*) is prefixed to the column to which such species belong.

## FIRST GRAND DIVISION, VASCULARES.

Genera 3040, Species 27729; Hot-house Species 6261; Green-house Species 7648; Hardy Ligneous Species 2512; Hardy Herbaceous Species 11308. † 482½ feet; ‡ 233½ feet; ≡ 22½ feet.

### CLASS I. DICOTYLEDONEÆ, OR EXOGENÆ (*exo*, outside, *geinomai*, to grow).

Genera 2407, Species 23027; Hot-house Species 4936; Green-house Species 6326; Hardy Ligneous Species 2478; Hardy Herbaceous Species 9287. † 482 feet; ‡ 214 feet; ≡ 15 feet.

#### SUBDIVISION I. DICHLAMYDÆ.

This subdivision comprehends all the Dicotyledonous plants, that have both a calyx and corolla, by which they are distinguished from Monochlamydeæ, in which the calyx only exists. It is in consequence of this high development of the floral envelopes, that the greater part of handsome flowering trees and shrubs are found in Dichlamydeæ, the rarely happening that those with a single floral covering have any brilliant coloring.

#### SUBCLASS I. THALAMIFLOREÆ. *Petals and Stamens inserted in the Receptacle.*

Genera 517, Species 4774; Hot-house Species 922; Green-house Species 1211; Hardy Ligneous Species 328; Hardy Herbaceous Species 2313. † 138 feet; ‡ 96 feet; ≡ 8 feet.

The insertion of the petals and stamens into the receptacle is the great character of this subclass, which, therefore, contains all the polyandrous plants of Linnæus, as the Calycifloræ contain the icosandrous genera of the same botanist.

#### SECTION I. *Carpella numerous, or Stamens opposite the Petals.*

##### 1. ORDER I. RANUNCULACEÆ.

Genera 29, Species 632; Hot-house Species 8; Green-house Species 19; Hardy Ligneous Species 43; Hardy Herbaceous Species 562. † 15 feet; ‡ 56½ feet; ≡ 5½ feet.

The greater part of the plants of this order are objects of interest with gardeners, containing, as it does, many of the most elegant or showy of the tribes of hardy plants. It is here that the graceful *Clematis*, the lowly *Anemone*, the glittering *Ranunculus*, and the gaudy *Pæony* are found; differing, indeed, in external appearance, but combined by all the essential characters of their fructification. It is remarkable, however, that the acrid and venomous properties of these plants are nearly as powerful as their beauty is great. They are all caustic, and in many of them the deleterious principle is in dangerous abundance. M. Decandolle remarks that its nature is extremely singular; it is so volatile, that, in most cases, simple drying in the air or infusion in water is sufficient to destroy it: it is neither acid nor alkaline; but its activity is increased by acids, honey, sugar, wine, or alcohol; and it is, in reality, destructible only by water. The crowfoots of our European pastures, and the *Anemone trilobata* and *triternata* of those of South America, are well known poisons of cattle. Blistering plasters are made in Iceland of the leaves of *Ranunculus acris*. The foliage of some species of *Clematis* is supposed to afford the means employed by beggars of producing artificial ulcers. Some of the *Aconites* are diuretic, especially *Napellus* and *Camarum*. *Delphinium Consolida* is said to be an ingredient in those French cosmetics, which are so destructive of the surface of the skin. The *Helleborus*, famous in classical history for its drastic powers, and the *Nigella*, celebrated in ancient housewifery for its aromatic seeds, which were used for pepper before that article was discovered, are both comprehended in *Ranunculææ*. The range of this order, in a geographical point of view, is very extensive. A great number have been discovered in

Europe, but they are so abundant in all parts of the world that an order can scarcely be found more universally and equally dispersed. It is singular, that, with the exception of the climbing species of *Clematis* and of *Xanthorrhiza*, scarcely an instance occurs in Ranunculaceæ of a shrubby stem. All the perennial species may be propagated by division, and those which are woody by that mode or by layers or cuttings; the annuals and most of the perennials bear seeds freely.

|                                                                 |       |                                                           |       |                                                                   |     |     |

## 7. ORDER II. DILLENIACEÆ.

Genera 12, Species 29; Hot-house Species 11; Green-house Species 18; Hardy Ligneous Species 0; Hardy Herbaceous Species 0.  $\uparrow$  0 feet;  $\downarrow$  0 feet;  $\pm$  0 feet.

Fine plants, almost exclusively confined to tropical countries. *Dillenia speciosa*, a native of India, is a most noble tree with large yellow flowers, rivaling those of a *Magnolia*. *Hibbertia volubilis* is a green-house plant well known for the beauty of its blossoms, and their powerfully fetid smell. The medical properties of this order are scarcely known; a decoction of the leaves or bark is astringent, and used for gargles; and the acid juice of the fruit of some of the species of *Dillenia* is used in India, mixed with water, as a pleasant beverage in fevers. The foliage of many of the species is extremely scabrous, whence the dried leaves are used for the same purposes as fish-skin and sand-paper in Europe; those of *Trachytella aspera* are even employed in China for polishing works of metal. Most of the species strike readily by cuttings of the ripened wood in sand under a bell-glass.

## 8. Tribe 1. DELIMACEÆ.

1609 *Tetracera L.*  
1584 *Dolicoarpus Rol.*  
1583 *Delima L.*  
1594 *Curatilla L.*  
1603 *Trachytella Dec.*

## 9. Tribe 2. DILLENEÆ.

1376 *Pachynema R. Br.*  
1595 *Pleurandra Lab.*  
2185 *Candollea Lab.*  
1597 *Hibbertia Andr.*

1610 *Wormia Rth.*  
1608 *Colbertia Sal.*  
1614 *Dillenia L.*

## 10. ORDER III. MAGNOLIACEÆ.

Genera 5, Species 37; Hot-house Species 3; Green-house Species 11; Hardy Ligneous Species 23; Hardy Herbaceous Species 0.  $\uparrow$  62 feet;  $\downarrow$  0 feet;  $\pm$  0 feet.

No one is ignorant of the grandeur of Magnolias, or of the delicious, though sometimes dangerous, fragrance of their blossoms; but it is less generally known, that, from their affinity to the trees that produce the famous Winter's bark and Melambo bark, they possess medicinal qualities of no common power. The bark of all of them is said to have a bitter flavor without any astringency, and combined with a hot aromatic principle. In the United States, the bark of *Magnolia glauca* and *Liriodendron tulipifera* is employed for the same purposes as Jesuit's bark, and from the fruit of *Magnolia acuminata* a tincture is prepared which has some reputation for removing attacks of rheumatism. The fruit of *Illicium anisatum* is the material which flavours the liqueur called Anisette de Bourdeaux. The Magnolias are exclusively inhabitants of Asia and America, no species having hitherto been found either in Europe or in Africa. The shoots of most of the species do not emit roots freely, and therefore they are generally propagated by layers, grafting, inarching, and sometimes by seeds; two or three of the species by cuttings.

## 11. Tribe 1. ILLICIEÆ.

1615 *Illicium L.*  
1602 *Drimys Forst.*

## 12. Tribe 2. MAGNOLIEÆ.

fig. 23. *herb.* 0.  $\uparrow$  62 feet.  
1619 *Michelia L.*

1618 *Magnolia L.* 21 0  
1617 *Liriodendron* 2 0

## 13. ORDER IV. ANONACEÆ.

Genera 9, Species 45; Hot-house Species 40; Green-house Species 1; Hardy Ligneous Species 4; Hardy Herbaceous Species 0.  $\uparrow$  11½ ft.;  $\downarrow$  0 feet;  $\pm$  0 feet.

The plants of this order are closely allied to Magnoliaceæ, from which they are principally distinguished by the absence of stipule, and by the structure of their anthers and seeds. The latter consist of a hard mass of albumen, ruminated, as the botanists call it, that is to say, perforated by the substance of the seed-coat, in every direction. They are all trees or shrubs, and chiefly inhabitants of the hottest parts of the tropics, but a few have been discovered straggling into the temperature zones of America. The fruit of the *Anona* is in many species highly esteemed as an article for the dessert, especially that of the Cherimoyer, which has the reputation of being the finest fruit in the world, next to the mangosteen. The hard fruits of the species of *Uvária* are highly aromatic; those of one of them furnish the *Piper athiopicum* of the shops. The genus *Asimina* is the only one which contains any hardy species, and these are so delicate as to be seen very rarely in this country. In Brazil, the bark of *Xylopia sericea* is used for cordage; for which it is admirably adapted. Cuttings or layers.

1622 *Anona Adan.*  
1623 *Monodora Dunal*  
1538 *Eupomatia R. Br.*

1626 *Asimina Adan.* 4 0  
1620 *Uvária L.*  
1621 *Unona L.*

1624 *Artabotrys R. Br.*  
1627 *Xylopia L.*  
1625 *Guattiera R. & P.*

## 14. ORDER V. MENISPERMACEÆ.

Genera 8, Species 29; Hot-house Species 20; Green-house Species 5; Hardy Ligneous Species 4; Hardy Herbaceous Species 0.  $\uparrow$  4 feet;  $\downarrow$  0 feet;  $\pm$  0 feet.

The order of Menispermaceæ consists entirely of twining shrubs with minute flowers. They are extremely dissimilar in habit from the orders which are placed near them, and occupy their present station entirely on account of certain minute but important characters in their fructification. With the exception of *Schizandra coccinea* none of them are worth cultivating as plants of ornament. The berries of *Lardizabala biternata* are sold in the markets of Chile, under the name of *Aguilboquil*, *Guilboqui*, or *Coguil-Fochi*, according to different travellers. The bitter, diuretic, and aperient roots of *Pareira brava* are the produce of the *Cissampelos*

*Paveira*; and the famous Columbo root, so much esteemed for its intense bitterness, and for its use in diarrhoea and dysentery, is the produce of the *Cocculus palmatus*. The poisonous drug called *Cocculus indicus* in the shops is the seed of a species of *Cocculus*, probably *tuberosus*. Several Brazilian species of *Cocculus* and *Classampelos* are said to possess powerful febrifugal properties. No species of *Menispermaceæ* is found in Europe; they are chiefly natives of tropical America and Asia. Cuttings.

17. ORDER VI. BERBERIDEÆ.

Genera 7, Species 33; Hot-house Species 0; Green-house Species 10; Hardy Ligneous Species 20; Hardy Herbaceous Species 3. ♀ 3½ feet; ♂ 2 feet; ≅ 0 feet.

With the exception of *Berberis* this order does not contain any genus of much interest; most of the others are low, inconspicuous, herbaceous plants; *Nandina* is an elegant Japanese shrub. The Berberises are all shrubs of much beauty and interest, especially the species with pinnated leaves, which are sometimes called Mahonias. These are all inhabitants either of Europe, Asia, or North and South America; none have ever been seen in Africa or New South Wales. Many of the finest species from Chile and India yet remain to be introduced. The berries of the Berberises are acid and astringent; the latter quality is especially abundant in the stem and bark. Cuttings, layers, division, and seeds.

|                           |     |   |                              |   |                         |                            |    |

18. ORDER VII. PODOPHYLLACEÆ.

Genera 2, Species 2; Hot-house Species 0; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 2. ♀ 0 feet; ♂ 1½ feet; ≅ 0 feet.

Little, interesting, herbaceous North American plants, nearly related on the one hand to *Nymphaeaceæ*, and on the other to the herbaceous genera of *Berberideæ*. Their juice is held to be purgative. Division.

|                            |   |   |                               |   |   |

19. ORDER VIII. HYDROPELTIDEÆ.

Genus 1, Species 1; Hot-house Species 0; Green-house Species 1; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ≅ 0 feet.

This order differs from *Nymphaeaceæ* chiefly in having a definite number of seeds. It consists of only two genera, each containing a single species. Both are little floating plants of tropical and northern America. Nothing is known of their properties. Division or offsets.

|                            |
|----------------------------|
| 1644 <i>Hydropeltis</i> L. |
|----------------------------|

20. ORDER IX. NYMPHÆACEÆ.

Genera 4, Species 31; Hot-house Species 19; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 12. ♀ 0 feet; ♂ 3½ ft.

Like the last, these are all floating plants, and, to gardeners, possessed of great interest, on account of the elegant form and various hues of their flowers. Three species are known as the lilies of our own streams and ponds, and the remainder occupy similar stations in other countries. Some of the Indian species of *Nymphaea* are delightfully fragrant. The holy Cyamus, or Pythagorean bean of antiquity, is the produce of the *Nelumbium*, a stately aquatic, which abounds in all the hotter countries of the East, where its roots are frequently used as an article of food. The ditches, about Pekin and other Chinese cities, are literally choked up with its abundance. The pericarpia or beans are oblong, hard, smooth bodies, and possess the power of vegetating after having been dried for even thirty years. The flowers and roots of the common white *Nymphaea* have been long celebrated for their sedative and antiaphrodisiacal qualities, which are, however, now considered doubtful. In Sweden, in years of scarcity, the roots of *Nöphar lutea* are pounded into cakes along with the inner bark of *Pinus sylvestris*.

This order has been the cause of much difference among botanists, as to its true station in a natural classification, its structure being of so doubtful a character as to leave room for disputing whether it belongs to *Dicotyledones* or *Monocotyledones*. Upon this subject M. Decandolle has the following remarks:—"Gartner declares that the embryo is undivided, and therefore monocotyledonous. In 1802, I remarked in the *Bulletin Philomathique* that the embryo both of *Nymphaea* and *Nuphar* is enclosed in a peculiar integument, and that a dicotyledonous structure is apparent when that integument is removed; shortly after, M. Mirbel declared that the embryo of *Nelumbium* has two thick cotyledons; in 1806, M. Turpin gave an accurate description of the fruit of *Nelumbium luteum*, without however removing the doubts about the real structure of the embryo, and two years afterwards his colleague, M. Poiteau, described the seed and germination of the same plant, pointing out that the embryo consisted of two thick cotyledons enclosed within a stipular membrane, but destitute of radicle: this was subsequently confirmed by M. Mirbel after very minute anatomical examination; that observer compared the seed of *Nelumbium* to the seed of *Amygdalus*, and also to that of *Piper* and *Saururus*, and also demonstrated that the structure of the stem was analogous to that of exogenous or dicotyledonous plants. A very different opinion was shortly afterwards held by M. Correa de Serra, an observer of the highest order, who admitted indeed that *Nymphaeaceæ* are exogenous, but contended that the parts which had been taken by previous observers for cotyledons were, in fact, a mere expansion of the radicle, and that cotyledons were as entirely absent in *Nelumbium* as in *Cuscuta*. In the meanwhile M. de Jussieu adhered to the old opinion, that *Nymphaeaceæ* are monocotyledonous; in which he was supported by the late Professor Louis Claude Richard, a name for ever memorable in the annals of Carpology, who published a new view of their structure, in which he differed materially from all his predecessors; this botanist considered the stipular membrane of Poiteau a simple cotyledon, and the cotyledons of that writer the hypoblastus, or body of the radicle; he also refused to admit any evidence derived from the anatomical structure of the stem. In this conflict of opinions, I have determined to station *Nymphaeaceæ* among *Exogènes*, for the following reasons: 1st, because the structure of their stem is that of *Exogènes* rather than of *Endogènes*; 2dly, because the two opposite bodies, enclosed within the little bag or stipular membrane, described by Poiteau, appear to be undoubtedly cotyledons, which is confirmed by the presence of a plumula between them in *Nelumbium*; 3dly, because of the structure of their flower, which has a great affinity with that of *Paponia*, *Magnolia*, and *Papaver*; 4thly, on account of the similarity between their fruit and stigma and that of *Papaver*; 5thly, because of their milky juice and convolute leaves, two characters which are not known to exist among *Endogènes*." Those who are interested in pursuing this curious discussion any farther, will find many remarks and illustrative figures in the English edition of the *Analyse du Fruit*, published by Mr. Lindley in 1819. Seeds and division.

## 23. ORDER X. SARRACENIÆ.

Genera 1, Species 4; Hot-house Species 0; Green-house Species 4; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Plants remarkable for the singular form of their leaves, which are tubular and hold water, and some species have lids or covers, which, it is alleged, shrink and close over the mouth of the tube in dry weather, so as to prevent the exhalation of the water. The order is chiefly distinguished from Papaverææ and Nymphaeææ in having a broad peltate leafy stigma. It consists only of one genus, containing six species, all inhabiting the swamps of North America. Division.

1555 Sarracenia L.

## SECTION II. Carpella solitary or connate; Placenta parietal.

## 24. ORDER XI. PAPAVERACEÆ.

Genera 12, Species 65; Hot-house Species 2; Green-house Species 1; Hardy Ligneous Species 0; Hardy Herbaceous Species 62. ♀ 0 feet; ♂ 18 ft.; ± 0 feet.

These plants are better known for their medicinal properties than for their beauty. Some of them are the common pests of corn fields, and with grain have been disseminated over all the world. Sanguinaria is a neat little American plant well known for its crimson juice, and the emetic purgative powers of its roots. The peculiar power of the poppy is, as is well known, narcotic; a property which pervades all the order, although in a less intense degree in all than in the official *P. somniferum*, from which exclusively the drug opium is obtained. The Mexicans use the expressed oil of the seeds of *Argemone mexicana* for polishing furniture. Division, seeds, or cuttings.

## 25. ORDER XII. FUMARIACEÆ.

Genera 6, Species 44; Hot-house Species 0; Green-house Species 10; Hardy Ligneous Species 0; Hardy Herbaceous Species 44. ♀ 0 feet; ♂ 13 ft.; ± 0 feet.

Tender herbs, with finely cut leaves and annual stems, abounding in a watery juice; without any appearance of milkiness. They are reckoned slightly diaphoretic and aperient, but their medical properties are trifling. Formerly they were combined with Papaverææ, from which they are now universally distinguished. The greater part of them are natives of hedges or thickets in the cooler parts of the northern hemisphere; two are natives of the Cape of Good Hope. Many of the species are beautiful ornaments of the flower-garden. Division or seeds.

## 26. ORDER XIII. CRUCIFERÆ (cruz, a cross, fero, to bear; form of corolla).

Genera 88, Species 761; Hot-house Species 0; Green-house Species 77; Hardy Ligneous Species 18; Hardy Herbaceous Species 666. ♀ 6½ ft.; ♂ 50 feet; ± 3 feet.

The importance of this order to mankind, and the singular nature of its botanical characters, render it expedient to speak very fully upon it: in which the remarks of the learned M. Decandolle, who has paid Cruciferae particular attention, will be chiefly followed. The order consists wholly of annual or perennial, often biennial, herbs, occasionally assuming a suffruticose habit; then, however, never exceeding the height of three feet. The roots are either thick and perennial, or annual or biennial and slender, almost always perpendicular and undivided. The young roots are tipped with a little sheath, called the coleorhiza, which is produced by the extended ruptured coat of the epidermis when the rootlet first appears. This is a curious character, and deserves attention. The stems are round or somewhat angular, branched, and often, even in the annual species, indurated at the base. The branches proceed from the axillæ of the leaves, but the uppermost ones are abortive in most cases. The racemes are always opposite to the leaves; sometimes the terminal branch is abortive, when the raceme appears to be terminal; but this is merely owing to that circumstance. The leaves are simple, generally radical or alternate, rarely opposite. The flowers are either white, yellow, or purple, or in a few Cape species bright blue. The fruit is called either a siliqua or silicula, the former being a linear pod containing many seeds, the latter a roundish pod containing one or very few seeds, whence this

order, which is the same as the Linnean class Tetradyndmia, is divided by Linnæus into two parts, called Siliquosæ and Siliculosæ. In the seed, the radical and cotyledons are applied to each other in different ways, from which the suborders of M. Decandolle derive their characters. When the edge of the cotyledons is pressed closed to the radicle, so that a cross section would be as at fig. 5. a, the cotyledons are said to be accumbent, as in all Pleurorhizææ; when the side of the cotyledons is pressed to the radicle as at b, the former are called incumbent, as in Notorhizææ. If the cotyledons are incumbent, and at the same time half folded together or conduplicate, as at c, the suborder Orthoplœææ is formed; when the cotyledons are incumbent and spirally twisted, so that a section would be as at d, they constitute the suborder Spirolœææ; and finally, when the cotyledons are incumbent, and doubled twice in their length, as at e, we have Diplocœææ.

The whole order is preeminently European; 166 species are found in the north and middle of Europe, and 178 on the sea-shores of the Mediterranean; 45 are found between Mogadore and Alexandria; 184 in the countries of the East, that is to say, Syria, Asia Minor, Tauria, and Persia; 99 in Siberia; 35 in China, Japan, and India; 16 in New Holland and the South Sea islands; 6 in the Mauritius and adjacent countries; 70 at the Cape; 9 in the Canaries; 2 in Saint Helena; 2 in the West Indies; 41 in South America: 48 in North America; 5 in Kamtchatka and the bordering islands; and finally, 35 are common to several parts of the globe. From this it appears that there are about 160 species in the southern hemisphere, and about 800 in the northern: or, if they are considered with reference to the zones of temperature, 205 are natives of the frigid zone of the northern hemisphere; 30 of the whole of the tropics; 548 of the temperate zone of the northern hemisphere; and 86 of the southern. The forty-first degree of north latitude may be considered the equatorial line of Cruciferae, about half being found on one side of it, and half on the other. Their station is very variable; many inhabit open sandy places, some form the vegetation about the limits of the perpetual snows of lofty mountains, and many follow the footsteps of man through all parts of the world.

The useful qualities of the turnip, the radish, the rape, and the cabbage and its multifarious varieties, are all well known. The greater part of the order consists of plants possessing high antiscorbatic powers. These appear to depend upon a certain acrid, volatile, oily principle, the chemical nature of which is imperfectly known. It is particularly abundant in the seeds of mustard and the roots of horseradish, and the leaves of *Lepidium latifolium*, which latter exercise a violent influence upon the organs of digestion. The same sort of acrimony, but in less degree, is found in the herbage of the scurvy-grass and the roots of the radish, which act much more mildly when taken inwardly; thus, when any cruciferous plants are found to be eatable, either from culture or other circumstances, it is to be understood to depend upon a reduction of this acrid principle. The exciting powers of this last are what render the horseradish, the scurvy-grass, and others, so remarkably useful as antiscorbatics; they are also believed to possess diuretic and diaphoretic properties. It is to be remarked that Cruciferae are always eatable when their texture is succulent and watery, as in the roots of the radish and the turnip, and the leaves of the cabbage tribe. A further diminution of the acrid principle is produced by blanching. Cruciferae are said to possess a greater share of azote than any other tribe of plants; as is apparent in their fetid smell when fermented. The embryo of all the order abounds in oil, whence many species are employed with much advantage for expressing, either for eating or for feeding lamps. Some of the species are extremely beautiful and fragrant, as the Stocks, the Gillyflowers, the Hesperides, the Candytufts, and many others. The Hutchinsias, Drabas, Cardamines, &c., are among the most interesting of alpine plants. Almost all the species are propagated by seeds, but some of them grow by cuttings, and the perennials by division.

27. SUBORDER I. PLEURORHIZÆ.  
ZÆÆ (pleuron, a side, rhiza, a root; radicle at the side of the cotyledons).

28. Tribe I. ARABIDÆÆ, or PLEURORRHIZÆ SILICOSE (siliqua, a long pod).

52. SUBORDER VI. SCHIZOPETALÆÆ.

- 1816 *Schizopétalon* Sims.

## 53. ORDER XIV. RESEDA'CEÆ.

Genus 1, Species 2; Hot-house Species 0; Green-house Species 6; Hardy Ligneous Species 0; Hardy Herbaceous Species 17. ♀ 0 feet; ♂ 10½ ft.; ± 0 feet.

This order differs from Cruciferae in the capsules being unilocular and the stamens indefinite, as well as in the seeds being destitute of an umbilical cord. Weeds of no interest, except the *Reseda odorata* for its delicious fragrance. *R. Luteola*, a common annual in waste places, yields a yellow color fit for dyeing. All natives of Europe and North Africa. Seeds.

1459 *Reseda* L. 0 • 17

## 54. ORDER XV. DATIS'CEÆ.

Genus 1, Species 2; Hot-house Species 0; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 2. ♀ 0 feet; ♂ 4½ feet; ± 0 feet.

Differs from the preceding order in having an inferior ovarium, and in the seeds being furnished with albumen. This order consists only of one genus, containing three species, natives of the south of Europe, Nepal, and North America. They are strong coarse hardy perennials, with the appearance of hemp-division.

2805 *Datisca* W. 0 3

## 55. ORDER XVI. CAPPAR'IDEÆ.

Genera 11, Species 72; Hot-house Species 51; Green-house Species 5; Hardy Ligneous Species 0; Hardy Herbaceous Species 16. ♀ 0 feet; ♂ 8½ feet; ± 0 feet.

These are nearly related to Cruciferae, of the properties of which they partake. Many are very pretty plants, especially *Cleome rosea*, and the various species of *Cratæva*. The common caper is an elegant bush, remarkable for its large white flowers and long purple stamens. The species are found occasionally in various parts of the world. The different kinds of *Capparis* are reputed to be stimulating, antiscorbutic, and aperient. The bark of the root of the common caper passes for a diuretic medicine. Several species of *Cleome* have an acrid taste, which has been compared by travellers to that of mustard. The root of *Cleome dodecandra* is employed as a vermifuge in the United States; and the leaves produce an inflammation of the skin, whence they are used in Cochinchina as a sinapism. Dec. Cuttings or seeds.

56. Tribe 1. CLEO'MEÆ.  
fig. 0 herb. 16. ♂ 8½ feet.  
1905 *Peritoma* Dec. 0  
1906 *Gynandropsis* Dec. 0  
1904 *Cleome* W. 0

1455 *Polanisia* Raf. 0 6  
57. Tribe 2. CAPPA'REÆ.  
1449 *Cratæva* L.  
1441 *Richia* R. Br.

1540 *Niebhria* Dec.  
1442 *Boscia* Lam.  
1539 *Capparis* L.  
1101 *Stephania* Dec.  
2045 *Morisonia* Plu.

## 58. ORDER XVII. FLACOURTIA'NEÆ.

Genera 3, Species 11; Hot-house Species 8; Green-house Species 3; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

A very small order, formerly comprised in Tiliacæ. It is remarkable on account of the structure of its fruit, to the inner lining of which the seeds are attached upon a branched placenta. Nothing is known of the properties of the Flacourtiæ. The berries of *Flacourtia Ramontchi* are eaten in Madagascar. The order consists entirely of small tropical trees or bushes. Cuttings.

59. Tribe 1. PATRISIE'Æ.  
1541 *Ryània* Vahl

60. Tribe 2. FLACOURTIE'Æ.  
2811 *Flacourtia* Herit.

61. Tribe 3. KIGGELARIE'Æ.  
2798 *Kiggelaria* L.

## 62. ORDER XVIII. BIXI'NEÆ.

Genera 3, Species 9; Hot-house Species 9; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

The plants of this order are few in number, and not remarkable either for beauty or use. The *Bixa Orellana* is chiefly known for producing the seed called in the shops *Arnotta* (*Rocou*, Fr.) and used for coloring cheese; the properties of the *Arnotta* are slightly purgative and stomachic. They are all bushes or small trees, and mostly tropical. Azaras, Chilian shrubs with fragrant flowers, are not yet known in the gardens of Europe. Cuttings.

1565 *Bixa* L.  
1569 *Lævia* L.

1567 *Prœkia* L.

1568 *Ludia* Lam.

## 63. ORDER XIX. CISTI'NEÆ.

Genera 3, Species 187; Hot-house Species 0; Green-house Species 55; Hardy Ligneous Species 111; Hardy Herbaceous Species 21. ♀ 22 feet; ♂ 6½ feet; ± 0 feet.

The common rock roses of our gardens give an accurate idea of this order, which contains little else. They are all very ornamental, and particularly well calculated for covering rockwork. They are natives of most parts of the world in dry elevated places. The gum called *Ladanum* is the produce of some kinds of *Cistus*; it exhales a fragrant perfume when burnt, and possesses slightly tonic and stomachic properties. Cuttings or seeds.

1589 *Cistus* Tou. 40 0  
1590 *Heliánthemum* Tou. \*71 17

1445 *Hudsonia* L.

292 *Lêchea* L. 0 4

## 64. ORDER XX. VIOLARIE'Æ.

Genera 12, Species 135; Hot-house Species 13; Green-house Species 13; Hardy Ligneous Species 0; Hardy Herbaceous Species 109. ♀ 0 feet; ♂ 11 feet; ± 0 feet.

This is one of the most favorite orders with gardeners; consisting, as it chiefly does, of the Violet genus, from which most of the others are recent dismembersments. The greater part are hardy herbaceous plants, some of which are remarkable for their perfume, others for their brilliant colours, and all for their neatness. They are natives of the temperate or cold zones of both hemispheres, often growing at great elevations above the sea. Among them is a tribe called *Alsodineæ*, consisting of suffruticose tropical plants; but none of them have been introduced into the gardens of this country. The attention of collectors should be directed to procuring the shrubby *Violacæ* of Brazil, some of which possess great interest. The medical properties of the order are found principally in their roots, which appear to possess, in all cases, emetic properties, in a greater or less degree. One of the *Ipeacuanhas* is the root of a Brazilian violet. M. Decandolle has the following observations upon the affinities of the *Violariæ*: — They are very nearly akin, he observes, to the *Polygalæ* and *Droseracæ*, and especially to the *Passifloræ*. From the first they are distinguished by their unilocular fruit, leaves furnished with stipules, and two-celled anthers; from *Droseracæ* by their solitary style, length-

ened embryo, and stipulate leaves, the vernation of which is involutive, not circinate. From *Passiflora* they differ in their fruit being capsular, not berried; in their albumen being compact and shining, not pitted; in their stamens being hypogynous, not perigynous; in their anthers being attached along their whole length, not fixed by their middle; finally, in their stigmas being one and not three. The genus *Calyptrion* approaches *Passiflora* in its twining stem, and *Hymenanthera* borders upon *Polygala* on account of its monospermous pericarpium with solitary pendulous seeds. Divisions, seeds, and cuttings.

68. ORDER XXI. *DROSERA'CEÆ*.

*Genera 5, Species 16; Hot-house Species 0; Green-house Species 5; Hardy Ligneous Species 0 Hardy Herbaceous Species 11. ♀ 0 feet; ♀ 2 feet; ♂ 2½ feet.*

The order of sun-dews is a small group of plants, natives of marshes or inundated grounds in all the temperate parts of the world. The species are very remarkable for the abundance of glandular hairs with which all the parts of the foliage are covered. Only two species are in any degree frutescent. The young leaves are always rolled up in the circinate manner, so remarkable in ferns. Their medicinal properties appear to be trifling: the leaves have the power of curdling milk. Divisions or seeds, some by leaves.

69. ORDER XXII. *POLYGALÆÆ*.

*Genera 6, Species 64; Hot-house Species 5; Green-house Species 41; Hardy Ligneous Species 1; Hardy Herbaceous Species 17. ♀ 1 foot; ♀ 5 feet; ♂ 0 feet.*

Most of the plants of this order are interesting, and deserving the attention of the gardener, some for their neatness, some for their beauty, and some for their use in medicine. They are natives of most countries, and are either low herbaceous plants, occasionally less than an inch in height (small specimens of *Polygala purpurea*), or shrubs varying from a dwarf, rigid, spiny habit, to a tall, graceful, drooping appearance. *Polygala* are remarkable for the union of their stamens into a single body, their one-celled anthers opening with a pore, and their irregular flowers, one of which is often keel-shaped, and beautifully crested or bearded. The leaves have generally a bitter astringent taste, which is much more abundant in the roots, combined with an acid and somewhat resinous flavor: these properties are particularly sensible in *P. Senega*, which is reputed a sudorific, diuretic, sialagogue, cathartic, or mild emetic, according to the manner in which it is administered. The *Yelhoi* of South America, the root of a species of *Monnina*, has the same properties as *P. Senega*, and is particularly used as a remedy for dysentery. The well known Rattany, or Ratanhia root, of Chile, is the produce of a plant of this order, and possesses powerful tonic and astringent qualities. According to the analysis of a French chemist, it contains gallic acid, but neither tannin nor resin. Cuttings or seeds,

70. ORDER XXIII. *TREMA'NDREÆ*.

*Genus 1, Species 6; Hot-house Species 0; Green-house Species 6; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♀ 0 feet; ♂ 0 feet.*

A very small order, containing only seven species, all small bushes, natives of New Holland, and remarkable for the peculiar neatness of their appearance. In habit, they may be compared to heaths, with which they agree in the anthers bursting by a pore at the end. Nothing is known of their properties. Cuttings or seeds.

1153 *Tetratheca* Sm.

71. ORDER XXIV. *PITTOSPORÆÆ*.

*Genera 4, Species 22; Hot-house Species 2; Green-house Species 20; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♀ 0 feet; ♂ 0 feet.*

Beautiful shrubs and small trees, with simple alternate leaves destitute of stipulas, and white or yellow flowers, chiefly natives of New Holland and the African islands. The order is distinguished by the imbricate aestivation of the sepals and petals, which last, as well as the stamina, are five and hypogynous, and by its minute embryo. Cuttings and seeds.

72. ORDER XXV. *FRANKENIA'CEÆ*.

*Genus 1, Species 10; Hot-house Species 0; Green-house Species 4; Hardy Ligneous Species 0; Hardy Herbaceous Species 6. ♀ 0 feet; ♀ 2½ feet; ♂ 0 feet.*

Distinguished from *Caryophyllææ* by the fruit not having a central separate placenta, but bearing the seeds on the inner margin of the valves. The species are natives of arid situations in Europe, Africa, and South America. They have not much beauty, and no known medical properties. Besides the genus here recorded, there are two others mentioned by M. Decandolle. Cuttings, division, or seeds.

SECTION III. *Ovarium solitary; Placenta central.*

73. ORDER XXVI. *CARYOPHYLLÆÆ*.

*Genera 26, Species 531; Hot-house Species 11; Green-house Species 27; Hardy Ligneous Species 1; Hardy Herbaceous Species 492. ♀ 1 foot; ♀ 38½ feet; ♂ 1½ feet.*

These consist of herbs or low undershrubs, inhabiting the mountains and pastures of all parts of the world. In Europe and Siberia they are particularly abundant, and least so in Africa and South America. Many are common weeds, as most of the *Cerastiums*, *Spergulas*, and others. Several of the *Silenes* are very ornamental, and among the *Arenarias* are to be found some dwarf species of considerable elegance. But it is in *Dianthus* that the pride of the order consists: this genus is almost unrivalled for the brilliancy of its colours, the neatness of its foliage, and the perfume of its flowers. From the finest of its species the title of the order has been derived. The virtues of *Caryophyllææ* are slight. *Saponaria officinalis*, and one or two others, have been praised for possessing antisyphilitic properties; the root of *Silene virginiana* is reputed anthelmintic; and the *Arenaria peploides*, being fermented, is used by the Icelanders for food. Cuttings, division, or seeds.

76. ORDER XXVII. LIN'NEÆ.

*Genera* 2, *Species* 43; *Hot-house Species* 0; *Green-house Species* 6; *Hardy Ligneous Species* 2; *Hardy Herbaceous Species* 35.  $\frac{1}{2}$  3 feet;  $\frac{1}{2}$  12 feet;  $\frac{1}{2}$  0 feet.

Separated by M. Decandolle from Caryophylleæ, from which it is well distinguished by its fruit having several cells, or in the language of the botanist just named, being formed by the cohesion of several carpella. Most of the species are pretty plants, bearing yellow, blue, or white flowers. They are of immense importance in the world, on account of the tenacity of their fibres when made into flax. The seeds of common flax are between mucilaginous and oily; the leaves of *Linum catharticum* and *L. selaginoides*, the latter a native of Peru, are purgative. Cuttings, division, or seeds.

921 *Linum Bauh.* \*2 34 | 419 *Radiola Dil.* 0 \*1

77. ORDER XXVIII. MALVA'CEÆ.

*Genera* 22, *Species* 391; *Hot-house Species* 203; *Green-house Species* 97; *Hardy Ligneous Species* 8; *Hardy Herbaceous Species* 83.  $\frac{1}{2}$  28  $\frac{1}{2}$  feet;  $\frac{1}{2}$  25 feet;  $\frac{1}{2}$  0 feet.

Before this order was dismembered of Bombacæ and Byttneriæ, it contained most of the grandest flowers in nature. Even now, the splendor of the various species of *Malva*, *Althæa*, to which the hollyhock belongs, and *Hibiscus*, renders it one of the most remarkable groups of plants. With the exception of the numerous genus *Sida*, nearly all Malvæcæ are objects worthy of the gardener's care, particularly those which are hardy. In stoves or green-houses, the softness of their branches and leaves renders them peculiarly liable to the attacks of the red spider, mealy bug, and scale, from which few collections are free; a circumstance which makes them less generally esteemed than the surpassing beauty of many of them merits. The greater part of the order is clothed with stellate pubescence, and a reniform one-celled anther is a character common to the whole. These two peculiarities, together with the alternate stipulate leaves, distinguish Malvæcæ from all the rest of Diethylmýdææ. All the species abound in a nutritive mucilage; a quality which renders the young heads of the Ochro, or *Hibiscus esculéntus*, an object of great value within the tropics, as an ingredient in soups. In Brazil, the *Abition* *esculentum* serves the same purposes. The emollient properties of *Althæa officinális*, or Guimauve of the French, are well known to physicians, as a remedy for catarrhs and pulmonary complaints. A decoction of the leaves of *Sphaeralcea cispátina* is used for similar objects in Brazil. A species of *Pavónia* is employed in the same country as a diuretic in the form of a decoction. The straight shoots of *Sida micrantha* are employed as rocket sticks at Rio Janeiro. The chewed leaves of *Sida carpinifolia* allay the inflammation occasioned by the stings of wasps. The tough fibres of many Malvæcæ are manufactured into cordage. Their petals are astringent; whence those of *Hibiscus rosa sinénsis* are used in China to blacken the eyelashes and the leather of shoes. The fibrous threads in which the seeds of *Gossypium* are enveloped furnish the valuable cotton, an article of immense importance to the world; these threads, when examined by the microscope, will be seen to be finely toothed, which explains the cause of their adhering together with greater facility than those of *Bombax* and several *Apocýnææ*, which are destitute of teeth, and which cannot be spun into thread without an admixture of cotton. Division, cuttings, or seeds.

80. ORDER XXIX. BOMBA'CEÆ.

*Genera* 11, *Species* 28; *Hot-house Species* 27; *Green-house Species* 1; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 0.  $\frac{1}{2}$  0 feet;  $\frac{1}{2}$  0 feet;  $\frac{1}{2}$  0 feet.

Distinguished from the last by the imbricate aestivation of the calyx, and the arrangement of the stamens in five sets, or, in Linnean language, brotherhoods. The species are mostly fine trees with large showy flowers, and natives of the tropics. Some of them are among the largest trees in the world; *Adansónia*, the Baobab of Senegal, has been seen with a diameter of twenty-five feet, and specimens of *Bombax Celba* and *Eriodéndron anfractuosum* are not uncommon an hundred feet in height. The wood of all the species is light and soft, as in Malvæcæ, from which this order probably does not differ in its medical properties. Cuttings or seeds.

81. ORDER XXX. BYTTNERIA'CEÆ.

*Genera* 28, *Species* 151; *Hot-house Species* 78; *Green-house Species* 73; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 0.  $\frac{1}{2}$  0 feet;  $\frac{1}{2}$  0 feet;  $\frac{1}{2}$  0 feet.

Much the same kind of plants as those of the two last orders, from which they were not formerly distinguished; and from which they scarcely differ, except in their bilocular anthers. Many of the Sterculiæ are fine umbrageous trees, the seeds of which are large and eatable; especially those of the famous Kola, which possess the property, being chewed, of rendering bad water pleasant to the palate. The seeds of the Chicha, another and very noble species of the genus, are highly esteemed in Brazil for the desert. *Astrapæa* and several other genera related to it are among the most beautiful in the world. The flowers of a species of *Pentápeta*, called by the Indians *Machucunha*, give out a mucilaginous refrigerant juice, which is employed in gonorrhœa. *Guazúma* *uhmifolia* has its fruit filled with a pleasant mucilage, which is sweet and very agreeable; an extract of the bark of the same plant is used in Martinique to clarify sugar; its old bark is employed, in the form of a strong decoction, as a sudorific. *Waltheria Douradinha* contains a great deal of mucilage, and is employed by the Brazilians as an antisyphilitic. Cuttings or seeds.

88. ORDER XXXI. TILIAEÆ.

Genera 12, Species 77; Hot-house Species 61; Green-house Species 5; Hardy Ligneous Species 11; Hardy Herbaceous Species 0. ♀ 14 feet; ♂ 62 ft.; ± 0 feet.

Trees, shrubs, or herbs, in general not remarkable for their beauty, the greater part of the last being the commonest weeds of the tropics. The Lime, from which the order derives its name, is a genus of fine trees with fragrant flowers, and Sparmannia and Entella are handsome broad-leaved green-house arborescent plants. The inner bark of Tilia is tough and separable, and supplies the material whence the Russian mats used by gardeners and others are prepared. Corchorus olitorius is cultivated in Egypt as a kitchen-garden vegetable; the fibres of the bark of Corchorus capsularis are twisted into fishing lines; and the roasted nuts of the Lime tree are reported to bear some resemblance to chocolate. Cuttings or seeds.

89. ORDER XXXII. ELÆOCA'RPEÆ.

Genera 4, Species 6; Hot-house Species 3; Green-house Species 3; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

These differ from Tiliaceæ in nothing except their lobed petals and anthers opening by two pores at the apex. The flowers of some of the species of Elæocarpus are fragrant, the fruit eatable, and the hard rose stones manufactured into necklaces. Cuttings.

90. ORDER XXXIII. CHLENACEÆ.

Genus 1, Species 2; Hot-house Species 2; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

This order, according to Petit Thouars, is allied to Malvaceæ, in having an involucre to the flower, and in the stamens being monadelphous; but, according to Jussieu, it is allied to Ebenaceæ, from the petals being connected at the base, and in the seeds being furnished with albumen. Shrubs and trees, with simple alternate stipulaceous leaves, chiefly natives of Madagascar. The genus Hugonia does not agree with the rest of the genera of this order, in being destitute of the involucre to the flower, therefore it is placed in Chlenaceis affines by Decandolle. Cuttings.

- 1935 Hugonia L.

91. ORDER XXXIV. TERNSTRÆMIAEÆ.

Genera 11, Species 19; Hot-house Species 10; Green-house Species 4; Hardy Ligneous Species 5; Hardy Herbaceous Species 0. ♀ 18 ft.; ♂ 0 feet; ± 0 feet.

A very small order, consisting wholly of trees or shrubs, bearing handsome white or yellowish flowers. They are nearly related to Camelliæ, from which they do not differ at all in habit. Nothing is known of their properties. Noronha states that a species of Saurauja found in Java has a subacid fruit, in flavor resembling the Tomato, and that is eaten by the Javanese under the name of Koleho. Inarching, cuttings, or layers.

- |                                                                                      |                                                                       |                                                                                                                                                                 |

97. ORDER XXXV. CAMELLIÆÆ.

Genera 2, Species 59; Hot-house Species 0; Green-house Species 59; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Camellias are too well known in our gardens to render it necessary to say much upon their peculiarities. The Camellia is one of the most beautiful, and the tea one of the most useful, plants in the world. Both are natives of China, Japan, or Nepal. The tea is well known for the stimulating influence of its decoction upon the nerves, which is attributed by Cullen to the presence of a narcotic principle. The seeds of Camellia oleifera yield a fine oil. None of the species bear fragrant flowers. Their nearest affinity is with Ternstræmieæ, from which they probably ought not to be separated. Cutting, grafting, or inarching.

98. ORDER XXXVI. OLACINEÆ.

Genera 4, Species 6; Hot-house Species 5; Green-house Species 1; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Smooth trees or shrubs, with simple stalked exstipulate alternate entire leaves, and little axillary flowers. Botanists doubt whether what is called a calyx is not rather an involucre, in which case the corolla would become a calyx, and the station of the order among Monochlamydeæ, rather than in this place. Cuttings.

## 99. ORDER XXXVII. AURANTIA'CEÆ.

Genera 11, Species 32; Hot-house Species 12; Green-house Species 20; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

These are also known under the name of *Hesperideæ*. They consist of trees or shrubs of the greatest beauty and utility. The well-known orange and lemon are the representatives of the order, the characters of which are so well defined that there is no material deviation from the type afforded by those species. The thick leaves, articulated with the petiole, and abounding in transparent reservoirs of odoriferous oil, are the most obvious peculiarities. The flowers are fragrant, and the fruit in all cases fleshy, and generally eatable. The wood is particularly close grained. The volatile oil contained in the reservoirs of the leaves and fruit possesses powerful tonic and stimulating properties. M. Decandolle thus explains the singular structure of the fruit of the orange: In the opinion of this learned botanist it consists, first, of a thick, valveless, indelible indusium or coat, which is most likely to be considered a continuous torus. Secondly, of several carpella, verticillate around an imaginary axis, often separable without laceration; membranous, and either containing seeds only, or filled with pulp, lying in innumerable little bags proceeding from the inner coats of the cells. Cuttings, and sometimes by layers, budding, grafting, and inarching.

## 100. ORDER XXXVIII. HYPERICINEÆ.

Genera 7, Species 90; Hot-house Species 4; Green-house Species 54; Hardy Ligneous Species 14; Hardy Herbaceous Species 38. ♀ 9½ ft.; ♂ 14½ ft.; ± 0 feet.

The whole of these abound in a resinous juice, and are in most cases glandular in some degree. Their leaves are all dotted, and, which is very remarkable, the dots are often black, even upon the yellow petals. These latter have a singular obliquity, which is not indicated by their outline, but by the arrangement of their veins. The juice just noticed as abundant in this order is yellow, viscid, rather bitter, often purgative or anthelmintic, and so very analogous to Gamboge, that the juice of *Hypericum baccatum*, and some other Guiana species, has received the name of American Gamboge. Most Hypericineæ are bitter, and slightly astringent, whence they have been used as febrifuges. A small part of the order is tropical; but in its most genuine form it consists of herbaceous or undershrubby plants, delighting in the shade of groves and thickets in the cooler parts of Europe and Asia. Nearly all the flowers are yellow; those of *H. cochinchinense* are dull red. Seeds, division, or cuttings.

## 105. ORDER XXXIX. GUTTIFERÆ.

Genera 11, Species 28; Hot-house Species 26; Green-house Species 2; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Trees or shrubs found in the hottest parts of the world, and well known by their thick entire opposite leaves and resinous juice. In the countries where they grow they are of great importance. One, the *Garcinia Mangostana*, bears a fruit, the equal of which is supposed not to exist. The well-known Gamboge is the inspissated juice of *Garcinia Gambogia*, and, perhaps, other species; the juice of others is found an efficacious vermifuge, and also a remedy for the chiggers, one of the worst pests of equinoctial America. The bark and fruit of many *Garcinias* are astringent. The unripe fruits of *Grias cauliflora* are pickled. The flowers of all the order being showy, the foliage good, and the properties interesting, every species deserves cultivation. Cuttings or layers.

## 111. ORDER XL. MARCGRAVIA'CEÆ.

Genera 4, Species 6; Hot-house Species 6; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Very curious half-climbing shrubs, all natives of hot countries. Some of them bear among the flowers, which are large and showy, singular hollow bodies, like the pitchers of *Sarracenia*. The order has been well illustrated by Professor Hooker, in the 160th article of his *Exotic Flora*. Cuttings.

112. SUBORDER I. MARCGRAVIEÆ.

1543 *Anthodma* Lab.  
1542 *Marcgravia* Plu.

113. SUBORDER II. NORANTEÆ.

1544 *Norantea* Aub.  
688 *Rhyschia* Jac.

## 114. ORDER XLI. HIPPOCRATEA'CEÆ.

Genera 5, Species 13; Hot-house Species 13; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Little is known of this order. The species are tropical arborecent or climbing shrubs, with opposite simple leaves, and small inconspicuous flowers. The genus *Tonella* contains some species known in Sierra Leone as bearing poisonous fruit. Cuttings.

100 *Hippocratea* L.  
102 *Anthodon* R. & P.

101 *Tonella* Vahl  
105 *Johnia* Rox.

HIPPOCRATEA'CEÆ SPURIEÆ.  
1936 *Trigonia* Aubl.

115. ORDER XLII. ERYTHROXYLÆÆ.

Genera 2, Species 4; Hot-house Species 4; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

This order is distinguished from Malpighiæcæ in the presence of albumen, and in the petals being furnished at the base with a scale; the habit of the plants is also different. Shrubs and trees, with simple alternate leaves furnished with axillary stipulæ. Native of South America, Mauritius, and Madagascar, and one from India. Cuttings.

1400 Erythroxylon L. | 1401 Sèthia Kth.

116. ORDER XLIII. MALPIGHIÆCÆÆ.

Genera 13, Species 72; Hot-house Species 72; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Undulated unguiculate spreading petals form one of the most obvious characters of this order, the species of which are all tropical, and are either trees or shrubs, often climbers. Many of the Malpighias are well known for the prurient hairs produced on the surface of their leaves; their fruit is eatable, their timber of a deep red color, and their bark a febrifuge. Their showy pink or yellow flowers, and firm neat foliage, render all this order worthy of cultivation, except Aspicarpa, which is a wood. Cuttings.

120. ORDER XLIV. ACERYNÆÆ.

Genera 2, Species 28; Hot-house Species 0; Green-house Species 1; Hardy Ligneous Species 27; Hardy Herbaceous Species 0. ♀ 7½ ft.; ♂ 0 feet; ± 0 feet.

Valuable trees, natives of the woods of Europe, Siberia, and North America. Their flowers are in all cases inconspicuous; the breadth and rich color of their leaves constituting their beauty. All the larger species abound in a very saccharine sap, from which sugar is prepared in North America; it is chiefly made from Acer saccharinum and Negundium, but may be obtained from many others. Commonly by layers or seeds, but all the species will grow by cuttings in sand.

2867 Acer L. | 25 0 | 2774 Negundo Moe. 2 0

121. ORDER XLV. HIPPOCASTANÆÆ.

Genera 2, Species 14; Hot-house Species 0; Green-house Species 0; Hardy Ligneous Species 14; Hardy Herbaceous Species 0. ♀ 4½ ft.; ♂ 0 feet; ± 0 feet.

The order is much valued for the grandeur of the foliage and flowers of most of the species, which are all hardy trees. Their bitter fruit has sometimes been used as a sternutatory; it contains a large quantity of potash, and an abundance of starch. The bark is astringent, bitter, and febrifugal, and has been recommended as a substitute for Cinchona. Seeds or layers, and by grafting.

1137 Esculus L. 6 0 | 1138 Pavia Boer. 8 0

122. ORDER XLVI. RHIZOBOLEÆÆ.

Genus 1, Species 3; Hot-house Species 3; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

A very distinct order closely allied to the Terebinthæcæ, but, from the hypogynous insertion of the petals and stamina, and the structure of its fruit, differs essentially from that order. It agrees with Hippocastanææ in the insertion of the petals and stamina, and in having opposite palmate leaves, but differs from it in having a large radicle and small cotyledons, not with a small radicle and large cotyledons as in that order. The order contains only one genus, the Caryocar, the Rhizobolus of Gærtner and Pêkea of Aublet; a genus remarkable for bearing the Butter and Saouari, or Suwarrow, nut. The last is not infrequent in our fruiterers' shops. It is sweet and palatable, containing a rich oil, and the pulp is dry, not buttery as in the Butter-nut. Large trees, natives of Guiana and Essequibo; propagated in our stoves by cuttings, in sand under a bell-glass.

1601 Caryocar L.

123. ORDER XLVII. SAPINDAÆÆÆ.

Genera 19, Species 88; Hot-house Species 72; Green-house Species 15; Hardy Ligneous Species 1; Hardy Herbaceous Species 0. ♀ 10 ft.; ♂ 0 feet; ± 0 feet.

One of the distinctive peculiarities of this order consists in the petals having an additional lobe in the inside, or a tuft of hairs instead. Nearly all the plants have compound leaves, and bunches of white flowers; a few of them are twining herbs, but the greater part are trees or shrubs, all natives of the warmer parts of the world, and, in a great proportion, of the East. The only genus which will bear the climate of England is Kôlreutéria, a fine shrub or small tree, with panicles of white or pale yellow flowers. Nephèlium and Dimocarpus are both genera bearing excellent fruit. The rind of the berry of Sapindus Saponaria is of a soapy quality, as the name of the plant indicates. The pulp of Melicocca and the arillus of Blighia sâpida are excellent eating. Cuttings, layers, or seeds.

124. Tribe 1. PAULLINIÆÆ.

125. Tribe 2. SAPINDEÆÆ.

1218 Sapindus L.  
1161 Blighia H. K.

## 127. ORDER XLVIII. MELIACEÆ.

Genera 14, Species 35; Hot-house Species 29; Green-house Species 6; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

The nearest affinity of this order is probably with Sapindacææ. It is particularly distinguished by the stamens being united into a tube bearing the anthers. The leaves are usually pinnated, and most of the species, which are all either trees or shrubs, are natives of tropical forests. *Mèlia* bears bunches of fine lilac-colored flowers, but few of the genera are interesting on account of their inflorescence. The qualities of the different species are little known. The bark of *Guàrea trichilioides* is said by Aublet to be purgative and emetic. The pulpy fruit of *Mèlia Azedarach* is said to be poisonous; both this part and the inner bark have been used as anthelmintics either in substance or in decoction. It is asserted by Michaux, that the pulp that surrounds the kernel is considered in Pekin a specific in scrophulous cases. The oil expressed from the seeds of the same plant is said to have strong antispasmodic powers. Cuttings or layers.

|                                                                                                                                      |                                                                                                                                           |                                                                                                                                                                                                     |

## 131. ORDER XLIX. AMPELOIDEÆ.

Genera 4, Species 53; Hot-house Species 31; Green-house Species 6; Hardy Ligneous Species 16; Hardy Herbaceous Species 0. ♀ 13 ft.; ♂ 0 feet; ± 0 feet.

The vine is the type and representative of this order. *Cissus* and *Ampelopsis* differ little from it in botanical characters, and not at all in habit. The common grape is the only species that bears really good fruit; the American kinds, with large fleshy berries, being spoiled by a disagreeable foxy flavor, which is not found to be removed by cultivation. Cuttings.

|                                                                                                        |                                                                                                           |

## 134. ORDER L. GERANIACEÆ.

Genera 5, Species 366; Hot-house Species 3; Green-house Species 276; Hardy Ligneous Species 0; Hardy Herbaceous Species 87. ♀ 0 feet; ♂ 15 feet; ± 0 feet.

The Geraniums are well known to all gardeners for their beauty, and the facility with which hybrid varieties are produced among them. *Geranium* and *Erodium* are chiefly natives of the northern hemisphere, and *Pelargonium* of the southern. Different as they appear from *Viniferæ* in most respects, there are some points in which a curious resemblance may be found between the two orders. The young stems of both are articulated and separable at the articulations; and the lower leaves are opposite, while the upper ones are alternate. In *Geraniacææ* no tendrils are produced, but the peduncles are opposite to the leaves, as in *Vitis*, and occupy the place of tendrils. M. Decandolle observes, that of the true *Geraniacææ*, some are slightly acid, especially those of which the leaves and bark are succulent; several exhale a resinous smell which is sometimes agreeable, but occasionally so powerful as to be unpleasant. The resinous principle is so abundant in *Sarcocaulon L'Heritieri*, that its stem burns like a torch, and exhales an agreeable perfume. The most common property of European geraniums is to be astringent, which is chemically determined by their juice being blackened by sulphate of iron; this is particularly remarkable in *G. Robertianum* and *sanguineum*, which are both accounted vulnerary, and in *E. moschatum*, *G. pratense*, and others, in which it is united to a slight aromatic principle, whence they have been recommended for various purposes, and among others for removing calculous disorders. The astringent property of the geraniums is also present in *G. maculatum*, which grows in much abundance about Philadelphia; the root of this plant, boiled in milk, is used for the cholera in children. Barton is of opinion, that it would be a good substitute for gum kino in nephritis and obstinate diarrhæas. Cuttings, division, or seeds; or sometimes by cuttings of the roots.

|                                                                                                  |                                                                                                  |                                                              |

## 157. ORDER LI. TROPEOLEÆ.

Genus 1, Species 11; Hot-house Species 1; Green-house Species 7; Hardy Ligneous Species 0; Hardy Herbaceous Species 3. ♀ 0 feet; ♂ 3 feet; ± 0 feet.

These are climbing or trailing herbs with handsome solitary axillary flowers, and fleshy stems and leaves. They are distinguished from *Geraniacææ* by their stamens being separate, and not agreeing in number with the petals; by their axillary flowers, and fleshy indehiscent fruit. It is very curious, that this is the only order in which the peculiar acid flavour of *Cruciferææ* is found to exist. *Tropeolum pentaphyllum*, with probably other species, is a powerful antiscorbutic. All are natives of shady places in various parts of South America. The roots of some are fleshy and eatable. Seeds or cuttings.

|--------------------------|-----|
| 1148 <i>Tropeolum L.</i> | 0 3 |
|--------------------------|-----|

## 138. ORDER LII. BALSAMINEÆ.

Genera 2, Species 19; Hot-house Species 2; Green-house Species 9; Hardy Ligneous Species 0; Hardy Herbaceous Species 8. ♀ 0 feet; ♂ 7 feet; ± 0 feet.

The flower of this order has been remarked by a learned botanist to be that of *Fumariacææ*, the capsule of *Oxalis*, the embryo of *Linum*, and the habit peculiar. The well-known elastic spring with which the seeds are ejected constitutes a principal character of the order. All the species are annuals, with the exception of *Impatiens fruticosa*; they delight in moist hot situations, generally within the tropics; and are remarkable for the singularity and varied colors of their flowers. Seeds, and sometimes by cuttings.

139. ORDER LIII. OXALIDEÆ.

Genera 3, Species 112; Hot-house Species 8; Green-house Species 93; Hardy Ligneous Species 0  
Hardy Herbaceous Species 11. ♀ 0 feet; ♂ 6 feet; ± 0 feet.

Formerly confounded with the last order. It is the opinion of modern botanists, that the species are more nearly allied to Rutacææ or Zygophyllææ, and that their character and peculiar habit are quite sufficient to distinguish them. The beauty of the genus *Oxalis* is very great, and the readiness with which the species may be cultivated and caused to flower, would have been expected to make them universal favorites; they are not, however, much seen in cultivation. Their properties are well known: all of them have a slightly acid taste, whence some have occasionally been employed as salad; their acidity is very agreeable and depends upon the presence of a small quantity of oxalate of potassa. In some of the species of equinoctial America oxalic acid exists in great abundance. Several species are employed in Brazil as a remedy for certain fevers of that country. Most commonly by division, offsets, or seeds, but also by cuttings.

1404 *Averrhoa* L. | 1413 *Biophytum* Dec. 0 1 | 1414 *Oxalis* L. 0 \*10

140. ORDER LIV. ZYGOPHYLLEÆ.

Genera 7, Species 32; Hot-house Species 8; Green-house Species 22; Hardy Ligneous Species 0;  
Hardy Herbaceous Species 2. ♀ 0 feet; ♂ 3 feet; ± 0 feet.

The hardness of the wood of the shrubby species of this order is most remarkable, if the softness of the stems of the herbaceous ones is remembered. To this the extreme difficulty of propagating *Guaiaacum* is to be attributed. *Zygophyllum Fabago* is employed as an anthelmintic, but it is in the *Guaiaacum* that the great medical virtues of the order are found: all the genus is extremely exciting; the wood and bark of *Guaiaacum officinale* and *sacntum* have a rather bitter acrid flavor, and are principally used as sudorifics, diaphoretics, or alteratives; they have been found to contain a particular substance differing both from gum and resin, which has been called guayacine. Many of the species bear beautiful flowers, especially the *Tribulus*, which, with their brilliant yellow *Cistus*-like blossoms, enliven many an arid waste in the tropics. None are found in the colder latitudes of the world. Cuttings, division, or seeds.

1305 *Fagnòia* Tou. | 1303 *Guaiaacum* L. | 1704 *Meliánthus* L.  
1307 *Lárrea* Cav.

141. ORDER LV. RUTACEÆ.

Genera 37, Species 162; Hot-house species 18; Green-house Species 137; Hardy Ligneous Species 4;  
Hardy Herbaceous Species 4. ♀ 22½ feet; ♂ 5 feet; ± 0 feet.

An interesting and extensive, but rather heterogeneous, group of plants, natives of all countries and all situations. The species are either fetid northern herbaceous plants, as the garden rue, or neat heath-like southern shrubs, with an aromatic odor, as the Cape Diosmas; broad or long-leaved Australian shrubs, with a stellate pubescence, as *Phebàlum*, or tropical trees with panicles of pallid minute flowers, as the *Cusparias* and *Zanthoxylums*. The medical properties of many genera are considerable. *Ruta* and *Péganum* are emmenagogue, anthelmintic, and sudorific. Cape Diosmas abound in a volatile oil of an agreeable smell, but acrid flavour; several of its species are reputed antispasmodics. The *Zanthoxylum* are said to possess acrid, stimulating, or tonic qualities; *Clàva Hérculis* and *fraxineum* are said, in America, to be powerful sudorifics and diaphoretics. According to Barton, they possess a remarkable power of exciting copious salivation, not only when applied to the mouth, but even when taken internally; they have both been found powerful remedies in paralysis of the muscles of the mouth. *Zanthoxylum caribæum* is regarded in Guiana as a detersive vulnerary and febrifuge. *Brúcea* is used as an astringent in dysenteries. The famous febrifugal *Angostura* bark is the produce of *Cusparia febrifuga*. Cuttings, division, or by inarching.

|                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                           |

147. ORDER LVI. SIMARUBACEÆ.

Genera 3, Species 5; Hot-house Species 5; Green-house Species 0; Hardy Ligneous Species 0;  
Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Thirteen plants, found in equinoctial America, constitute this order. They are trees or shrubs, with an intensely bitter bark, a milky juice, and pinnated leaves. The *Simariba* officinalis is well known as the most pure and intense bitter hitherto discovered; the same property exists, in a milder degree, in the rest of the order. *Quássia amara* is a very ornamental plant, but rare, at present, in collections. Cuttings.

1316 *Quássia* W. | 1317 *Simarùba* Aub. | 1318 *Simàba* Hil.

SECTION IV. Fruit (gynobasic) inserted into a fleshy Receptacle, with which the Style is continuous.

148. ORDER LVII. OCHNACEÆ.

Genera 3, Species 15; Hot-house Species 14; Green-house Species 1; Hardy Ligneous Species 0;  
Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Beautiful yellow-flowered tropical shrubs with lucid leaves. The roots and leaves of *Walkèria serrata*, a Cingalese plant, are bitter; a decoction of them, either in water or milk, is used in Malabar as tonic, stomachic, and antiemetic. The bark of *Gómphia hexaspèrma* is found useful in healing sores produced in cattle in Brazil by the stings of insects. Cuttings.

1582 *Ochna* Schreb. | 1315 *Gómphia* Schreb.  
744 *Walkèria* Schreb. | 1151 *Castèla* Turp.

## 149 ORDER LVIII. CORIARIÆÆ.

Genus 1, Species 2; Hot-house Species 0; Green-house Species 1; Hardy Ligneous Species 1; Hardy Herbaceous Species 0. † 1 foot; ‡ 10 feet; ≧ 0 feet.

Five species constitute the whole of this order, distributed in South Europe, New Zealand, Peru, and Mexico. They possess no beauty, and are only interesting on account of their problematical station in a botanical arrangement. The leaves of *C. myrtifolia* are astringent, and are employed in dyeing black. Its berries are very poisonous. On one occasion, during the Spanish war, fifteen French soldiers were taken ill after eating them, and three died from their powerful narcotic effects. Cuttings and suckers.

2797 Coriaria L. 1 0

## SUBCLASS II. CALYCIFLORÆÆ. Petals separate, inserted in the calyx.

Genera 1149, Species 11435; Hot-house Species 2089; Green-house Species 3486; Hardy Ligneous Species 1308, Hardy Herbaceous Species 4552. † 283 feet; ‡ 156 feet; ≧ 7 feet.

## 150. ORDER LIX. CELASTRIÆÆ.

Genera 18, Species 114; Hot-house Species 19; Green-house Species 53; Hardy Ligneous Species 42; Hardy Herbaceous Species 0. † 46½ feet; ‡ 0 feet; ≧ 0 feet.

This order differs from the succeeding, in having the stamens alternate with the petals; the sepals imbricated in aestivation; and the ovary wholly superior. It consists entirely of shrubs or small trees, with simple, rarely compound, alternate or opposite leaves, and inconspicuous flowers of a greenish or white colour. Several are favourite ornaments of our shrubberies, as the *Staphylæa*, the *Celastrus*, and the *Euonymus*; the latter of which is valued on account of its beautiful-colored fruit. The fruit of *Euonymus europæus* is a brisk purgative, as is also the inner bark, and in strong doses powerfully emetic. The famous Paraguay tea is the foliage of a species of *Ilex*. The bark of *Prinos verticillatus* possesses such active, astringent, bitter, tonic, and febrifugal qualities, that it is used in North America, with success, as a substitute for Cinchona. A decoction of the twigs of *Maytenus boaria* is used to bathe the swellings produced by the poisonous shade of the tree Lith. Cuttings, suckers, layers, and seeds; sometimes by grafts.

|                                |                                  |                              |       |

## 154. ORDER LX. RHAMNÆÆ.

Genera 18, Species 171; Hot-house Species 32; Green-house Species 87; Hardy Ligneous Species 51, Hardy Herbaceous Species 1. † 79½ feet; ‡ 3 feet; ≧ 0 feet.

In habit, this altogether agrees with the last, from which the medical properties of the species are not widely different. Throughout the order, as far as it has been examined, there is a remarkable agreement between the fruit and the inner bark, especially in *Rhamnus catharticus*, *Frangula*, and others, in which they both are purgative and emetic. Some, as the *Jujuba* and the African *Lote*, nevertheless, yield a wholesome and agreeable fruit; and the berries of the greater number yield, under the chemist's hands, green or yellow dyes of much importance in manufactures. The leaves of *Rhamnus Thecæans* are substituted for tea by the poorer sort among the Chinese. The bark of *Ceanothus cæruleus* is esteemed in Mexico as a good febrifuge. Cuttings, suckers, and seeds.

## 155. ORDER LXI. BRUNIAÆÆ.

Genera 7, Species 30; Hot-house Species 0; Green-house Species 30; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. † 0 feet; ‡ 0 feet; ≧ 0 feet.

Small heath-like shrubs, all natives of the Cape of Good Hope, and extremely ornamental, both in flower and foliage. Their properties are unknown. Cuttings.

|                             |                             |                              |

## 156. ORDER LXII. SAMYDEÆ.

Genera 2, Species 14; Hot-house Species 14; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. † 0 feet; ‡ 0 feet; ≧ 0 feet.

Tropical shrubs or small trees, with entire, stipulate, alternate leaves, covered with pellucid dots, and axillary flowers of little show. Some of the species of *Samyda* are pretty, but very rare. Their properties are unknown. M. Decandolle remarks, that in their fruit they approach *Bixineæ* and *Flacourtiæ*; but on account of the position of their stamens must be arranged in the vicinity of *Rhamnæ* and *Rosacææ*. Cuttings.

1368 *Samyda* L. | 1369 *Casearia* Jac.

## 157. ORDER LXIII. HOMALIÆÆ.

Genera 4, Species 8; Hot-house Species 5; Green-house Species 2; Hardy Ligneous Species 1; Hardy Herbaceous Species 0. † 3 feet; ‡ 0 feet; ≧ 0 feet.

Evergreen handsome shrubs, with alternate leaves and deciduous stipule; they are readily known by their parietal placenta, an unusual character among the orders that surround them. *Blackwellia fagifolia* has fine bunches of starry white fragrant flowers. *Aristotèlia* is an evergreen half hardy shrub, with eatable berries. Little is known of their medical properties; the root of *Homalium Racoubea* is used in Guiana as a cure for gonorrhœa. Cuttings or layers.

1598 *Homalium* Jac. | 1146 *Astránthus* Lou. 1 0  
1465 *Blackwellia* Com. | 1438 *Aristotèlia* L.

158. ORDER LXIV. CHAILLETIA'CEÆ.

Genus 1, Species 1; Hot-house Species 0; Green-house Species 1; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

This order contains only three genera, *Chaillètia*, *Leucòsia*, and *Tapira*. It agrees with *Terebinthaceæ* in being furnished with a corolla and calyx. Fruit furnished with a dry covering, including a two or three celled nut, each cell containing one pendulous seed. Shrubs with entire alternate leaves, furnished with stipules and axillary and terminal paniced racemes of small white flowers; chiefly natives of tropical Africa and its islands. The kernel of the fruit of *Chaillètia toxicària* is used by the natives of Sierra Leone for poisoning rats and mice. Cuttings.

815 *Chaillètia* Dec.

159. ORDER LXV. AQUILARIA'NEÆ.

Genus 1, Species 1; Hot-house Species 1; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

The plants contained in this order are very imperfectly known. It differs from the preceding in the seeds being erect, not inverted, as well as in the capsules being 2-valved. Trees with alternate entire leaves, natives of Asia. Cuttings.

1370 *Aquilaria* L.

160. ORDER LXVI. TEREBINTHA'CEÆ.

Genera 27, Species 142; Hot-house Species 58; Green-house Species 62; Hardy Ligneous Species 22; Hardy Herbaceous Species 0. ♀ 40½ ft.; ♂ 0 feet; ± 0 feet.

This order is, notwithstanding the labours of several botanists, in a very confused state; from want of sufficient knowledge of many of the genera, which have been hitherto imperfectly described, it is difficult either to determine the value of the characters assigned to the tribes, or the dignity of the tribes themselves. All the species are shrubs or trees, with alternate exstipulate leaves, and inconspicuous flowers, and abound in a balsamiferous resin, which is chiefly present in the leaves and bark, and from which the denomination of the order has been derived. Notwithstanding the minuteness of their flowers, many of the species are valuable as ornamental plants, on account of the beauty of their foliage, others for the sake of their utility in arts or medicine, and others for their fruit. The Cashew and the Pistachio are valuable for their nuts, which are well known articles in the markets of Europe. The Spondias and Mango are equally famous in the tropics. The well-known balsam of Mecca is the produce of the *Balsamodèndron gileadènsis*; and balm of Acouchi, of the *Ycica heterophylla*; gum comes from *Amýris elemifera* and *Ycica leptophylla*; mastich from *Pistacia atlántica* and *Lentiscus*; and Venetian turpentine from *Pistacia Terebinthina*. *Schinus Mòlle* produces a resin, which in Peru is used as a dentrificæ, as myrrh is with us. Some of the best varnishes are prepared from the exudation of *Ycica guianènsis*, *Rhús vèrnix*, copallina, *Melanorrhæa*, and others; the finest kinds of incense are also afforded by plants of this order, such as the wood and resin of the different species of *Ycica*, of *Amýris balsamifera*, and of *Canarium* commune, the *Coumia*, which is used in Guiana for such purposes, and finally, the *Boswèllia serrata*, which is the true frankincense of Indian temples. But among the fragrant and wholesome plants of which the order chiefly consists, lie concealed others in which acrid and poisonous qualities no less abound. Such are several species of *Rhús*, the juice of which produces blisters upon the skin; and the *Amýris toxicifera*, the juice of which is accounted poisonous. To conclude this long list of the uses and dangers of *Terebinthaceæ*, the bark of *Rhús glabra* is used as a febrifuge and as a mordant for red colors, and that of *Rhús Coriària* as a powerful means of tanning the skins of animals. Cuttings, layers, and seeds.

168. ORDER LXVII. LEGUMINOSÆ.

Genera 244, Species 2026; Hot house Species 886; Green-house Species 675; Hardy Ligneous Species 177; Hardy Herbaceous Species 888. ♀ 117½ ft.; ♂ 58½ feet; ± 0 feet.

The family to which the various kinds of pulse belong is one of the most familiar to the world, and at the same time one of the most useful to mankind. Their papilionaceous flowers characterise a large number, and their pods and pinnate leaves the remainder, with a few exceptions which it is not necessary to particularise. As objects of ornament, many are possessed of unrivalled beauty, for example, among hardy flowering trees, the *Robinia* and the *Laburnum*; among shrubs, for decorating the borders of the flower-garden, the various tribes of *Cytisus*, *Caragana*, *Colutea*, *Amorpha*, and others; among hardy climbers, the far-famed *Wistaria* of China, and its sister of North America, with the species of the herbaceous genera *Ficia* and *Lathyrus*; and, lastly, among hardy herbaceous plants, the numerous species of *Lupinus* and *Astragalus*. Great, however, as is the beauty of the Leguminosæ which can brave the inclemencies of the seasons of Northern Europe, it must give way before the splendor and elegance of their brethren of the tropics. The flowers of the *Erythrina*, or Coral tree, are of the deepest crimson, and borne in profusion upon some of the loftiest trees of the forest. The *Bauhinias*, with their twin leaves, hang in festoons of flowers from branch to branch, and are only rivalled by the less vigorous and elegant, but more richly colored blossoms of the *Mucunas*. But all these, with their broad heavy foliage and gaudy colors, are far surpassed by the rugged trunks, trembling airy foliage, and golden flowers of the fine-leaved *Acacias*, which cast a charm over even the most sterile deserts of burning Africa. While the forests of hot countries are thus indebted to species of this order for their timber, the meadows and pastures of the same latitudes are enamelled with the flowers of myriads of *Hedysarums* and *Desmodiums*, and animated by the wonderful motion of sensitive plants. As in our own country, the gayest part of our scenery is in many places indebted to the yellow flowers of our furze and broom, so in other countries the same effect is produced by other genera of Leguminosæ; by *Liparia*, *Borbònia*, and *Asplathus*

at the Cape of Good Hope, and by the Pultenacas, Daviesias, Aotuaes, and multitudes of similar genera in New Holland. The wood of the order is very hard and durable, with a yellow tinge, sometimes changing into green, as in the *Laburnum* of Europe, and in the better known Brazil wood of commerce, produced by *Cassipoua*. The following useful remarks upon the properties of the order are made by M. Decandolle:—

"The family of leguminous plants, though established upon characters of primary importance, offers, nevertheless, so large a number of species and such singular botanical anomalies, that it is easy to foresee that its properties will exhibit little uniformity. Still more exceptions may be anticipated, if one reflects that the chemical principle which is found most abundantly in every part of leguminous plants, and to which we must attribute their principal properties, is the extractive. It is probable that this principle, either from its own nature, or from its peculiar power of uniting with different matters, or perhaps instead of being a simple principle, it is rather a compound of different matters; it is probable, I say, that the extractive principle exhibits much less uniformity in its results than any other. It is, without doubt, to the presence of the extractive principle, in considerable quantities, that many leguminous plants owe their purgative properties, which are common to several extracts, and which many chemists attribute to the acetate of potash, which they are almost universally found to contain. Thus the leaves and foliaceous pods of *Cassia Senna* Lin., of *Cassia lanceolata* Forsk., of *Cassia marginata* of the Antilles, of the *Cassia marylandica* employed in the United States, of *Colata arborescens*, of *Genista purgans*, and perhaps also of *Coronilla Emericus*, act as brisk purgatives, and often cause wind and pain in the bowels. The juice of *Coronilla varia* excites vomiting, and may even become poisonous when taken in too large quantities. It is, perhaps, from a different cause that the pulp which is contained in the husks of leguminous plants operates upon the human body; it purges gently without causing the least pain, and ought to be considered as laxative rather than purgative. Such is the character of the juicy pulp that exists in the *Cassia fistula* Lin., in the *Tamarindus indica* Lin., in the *Ceratonia siliqua* Lin., and probably in the *Inga vera* and *I. punctata*, which are eaten in small quantities in the Antilles, but which, taken more copiously, would have the same effect as our Carobs. There are some fruits of Leguminosæ, for example, the *Sophora* and the *Gleditsia*, with tumid pods, in which is found a juice which surrounds, it is true, the seeds, as in the plants just mentioned, but which differs from them altogether in its very astringent and nauseous flavour; the nature and properties of this juice deserve to be examined by chemists, and would undoubtedly throw some light upon the nature of Leguminosæ. I am induced to think, that the astringent juice of the *Sophora* is a secretion of the pericarp, whilst the sweet and purgative juice of the *Cassia* would be a secretion of the external part of the seed; but this hypothesis requires to be verified: what leads me to this opinion, is the flavour commonly found in husks; in the Carobs, for example, the husk is astringent, and the pulp sweet and laxative. But let us return to the properties which may be attributed to the extractive principle. It is undoubtedly from some one of these modifications that the singular property of the *Piscidia* and many *Galegas* is derived, which are employed in America to stupefy fish, which are taken by this means as readily as with *Nux vomica*. The decoction of the root of *Galega virginiana* is considered in America as a powerful vermifuge. It is, perhaps, indeed, to the very same cause that the rubefacient powers of the fresh leaves of some Leguminosæ are to be ascribed, which act readily upon the skin if applied as plasters; as, for example, in *Ornithopus scorpioides* among ourselves, and *Moringa pterygosperma* elsewhere. It appears to me, that it is to the greater or less considerable mixture of the extractive principle with the *fecula* contained in the seed, that the different properties of the pulse of leguminous plants may be attributed. If found in small quantities, the seed may serve as food for man and animals, as we see in French beans, peas, lentils, chick peas, beans, and many others, &c. If found in a more considerable quantity, it will render them purgative or emetic, as in the *Cytisus Laburnum*, the *Anagyris foetida*, and even in most *Coronillas*. It is remarkable that the botanical characters of Leguminosæ should so strictly agree with the properties of their seeds: the latter may be divided into two sections; namely, first, those of which the cotyledons are thick and filled with *fecula*, and destitute of cortical pores, and which, moreover, in germination do not undergo any change, but nourish the young plant by means of that supply of food which they already contain; secondly, those of which the cotyledons are thin, with very little *fecula*, and furnished with cortical pores, and which change at once into leaves at the time of germination, for the purpose of elaborating food for the young plant. All the seeds of the first section are employed as food in different countries; none of those of the second section are ever so employed: the *Cajan*, which has long been classed among the *Cytisi*, was apparently an exception to this general rule; but observation has proved the contrary. Bearing in mind its known properties, I formerly paid particular attention to its structure, and I have shown in a note which accompanies my catalogue of the Montpellier garden, that the *Cajan* forms a particular genus much more nearly allied to the French bean than to the *Cytisi*, and that it, in fact, belongs to the first of the sections which I have just described. The seeds of Leguminosæ present also many other anomalies more difficult to reduce to any fixed laws: thus some are found which contain a rather large portion of fixed oil; such as the seed of the *Arachis hypogæa*, lately introduced into European agriculture, and that of *Moringa pterygosperma* which produces oil of ben: there are some, of which the flavour and smell are rather powerful; as the seed of *Dipterix* or *Coumarouina odora* of Aublet, which, under the name of Tonquin bean, is used for perfuming snuff: there are others which, like the chick pea, have rather a bitter taste and exciting properties, and are on that account administered for the jaundice. There are others again, like those of the *Andira*, which are so bitter as to be used in Java and Brazil as tonic, alexiteric, and vermifuge. In a word, are not the aperient and diuretic properties which are observable in the herbage and the roots of many leguminous plants, such as broom, beans, *Ononis*, *Moringa pterygosperma*, *Anthyllis crœtica*, &c., to be attributed to a modification of this extractive principle? There are, in another view, roots which are furnished with tubercles, that is to say, with reservoirs of *fecula*, which furnish mankind with wholesome food, as we see in the *Lathyrus tuberosus*, which is eaten in Holland, the *Dolichos tuberosus*, and the *D. bulbosus*, which the Indians use as food. The roots of the liquorice have a sweet and mucilaginous taste, which is well known by every body, and which, united to an acrid and rather exciting principle, causes it to be employed as a pectoral; the analysis of this root, published by M. Robiquet, proves that, independently of its woody skeleton, the same kind of amylaceous *fecula* is found as in the tuberous roots of which we have just been speaking; it is thence seen that the acrid flavour of decoctions of liquorice depends on the small quantity of resinous oil which it contains, and that its sweet properties are by no means analogous to common sugar, since it is insoluble in cold water, soluble in warm water or in alcohol, not capable of fermentation, and does not yield to the action of nitric acid any of the known products of sugar. It may here be added, that the sugary flavour of liquorice, and its other properties, are not confined to this genus; they are found equally in the roots of *Trifolium alpinum*, vulgarly called Mountain liquorice; in those of the *Abrus precatorius*, from which a pectoral draught is prepared in Hindoostan, called *Velti*, and in others. The barks of some trees of the leguminous class are remarkable for their bitterness, and are used as febrifuges; the different kinds of *Geoffroya* and *Andira* possess this bitter and febrifugal quality in a remarkable degree; in India, the bark of the *Agati grandiflora* and of the *Guilandina Bonducella* are employed for the same purpose. The barks of many leguminous plants are also remarkable for their astringent qualities, caused by the quantity of tannin which they are found to contain; this is observable in the *Acacia Catechu*, and in the *Acacia arabica*, which is used for tanning leather, and elsewhere. It is well known that almost all colouring matter proceeds from the extractive principle; and as it appears that this principle abounds in Leguminosæ, we ought to find in them a considerable number of the colors which are used by dyers: to this family, in fact, belong the principal blue colors, known by the name of indigo, extracted from every kind of *Indigofera*, and from some *Galegas*; and the red colors, which are yielded by all the species of *Cassipoua* and of *Hematoxylon*. We may add the red juice, which is drawn from the *Pterocarpus draco* and *santalinus*, under the name of sandal and of dragon's blood; from *Butea frondosa*, under the name of gum lac; and also from *Dalbergia Monetaria*. These juices appear to differ in many particulars, but their history and analysis are at present so far from being known, that it is impossible to form a true estimate of the nature of their differences. But anomalies of this nature are far from being confined to the plants just mentioned. Among the exotic drugs employed in the arts they are very common: such, for example, are the balsam of Capivi, produced by the *copaifera*; the balsam of Peru, which,

Mutis says, is obtained from *Myrsopernum perufferum*, and the balsam of Tolu from *M. toluiferum*; the Cachou, which has been found to be almost pure tannin; and which is supposed to be produced by *Acacia Catechu*; of the same character is that remarkable resin that is yielded by *Hymenaea Coubariti*; gum Arabic, produced by the bark and roots of *Acacia vera*, *Sénégal*, *arabica*, and others; gum tragacanth obtained from *Astragalus creticus*, *gummifer*, and *verus*; and finally, manna, secreted by *Alhagi Maurorum*. Cuttings and seeds; some by division.

The arrangement of this tribe of plants has been found to be attended with much difficulty. By Linnæus, and the writers who succeeded him, the number of genera was much smaller than those admitted by botanists of the present age; many additions have been made in consequence of the discovery of New Holland, and a large number of subdivisions in old genera have been from time to time introduced by one writer or another. To combine these scattered improvements under one uniform system has lately been attempted by the learned botanist, from whom the foregoing extract has been taken. M. Decandolle's method being here adopted, it will be useful to explain the principles upon which it is founded. He divides Leguminosæ into two grand divisions, the first of which consists of plants the radicle of whose seed is curved back upon the edge of the cotyledons, and the second of those whose radicle and cotyledons are straight: the former are CURVE'MBRIÆ, the latter RECTE'MBRIÆ. In the *Curve'mbria*, certain diversities in the structure of the calyx and corolla again divide into two principal forms: one of which, comprehending all the genera with papilionaceous flowers, is called Papilionacæ; and the other, consisting of a very small number of species, with one or two petals or more, and an obscurely lobed calyx, is called Swartziæ. The last is not subdivided, but the Papilionacæ resolve themselves into the two great tribes pointed out by M. Decandolle, namely, those with fleshy cotyledons and eatable pulse, *Sarcotobæ*; and those with foliaceous cotyledons and seeds which are not eatable, *Phyllotobæ*. Each of these is divisible by three, upon slight differences in the fructification. In *Recte'mbria* two suborders, Mimisæ and Cesalpines, are formed upon variations in the æstivation of the calyx and corolla; in the former, it is valvate, in the latter, imbricated; the first constitute a single tribe, the latter divide into three, distinguished by less momentous peculiarities of structure. Having premised thus much, the following tabular explanation will be intelligible:—

193. ORDER LXVIII. ROSACE'Æ.

Genera 46, Species 783; Hot-house Species 12; Green-house Species 73; Hardy Lignaceous Species 478; Hardy Herbaceous Species 219. † 199½ ft.; ‡ 28½ ft.; § 0 feet.

With the exception of *Chrysohalæna* and *Sanguisorbea*, this order is so uniform in its appearance, that *Rosa*, the type from which all the other genera are to be considered variations, when justly understood, will be found to contain every form of structure which is essential to the order. Having stated this, it will be at once obvious, that if the other genera have such close affinity to *Rosa*, they must also bear a great analogy in beauty. And this is, indeed, the fact. *Amygdalus* and *Prunus* among trees, and *Potentilla*, *Gæum*, and others, among herbaceous genera, rival the rose in their blossoms, and, in many particulars, surpass that most lovely of all flowers in foliage and general appearance. But it is not for charms alone of smell, or blossom, or foliage, that this order has fixed itself so high in the estimation of mankind. It has also the rare merit of comprehending all the most important of the fruits of the temperate regions of the world. Thus the apple and the pear belong to *Pyrus*, the apricot to *Armeniaca*, the plum to *Prunus*, the peach and the nectarine to *Pærsica*; *Eriobotrya* produces the loquat, *Mespilus* the medlar, and, finally, the quince is borne by the *Cydonia*. The medical powers of many plants of this order are not less active than their fruit is excellent. The principal of these is the well-known Prussic acid, which exists in abundance in the leaves and kernels of many genera, especially of *Prunus* and *Amygdalus*: it is the basis of Laurel water, which, when taken in small doses, acts either as a violent purgative or as an emetic; and, in stronger doses, is said to destroy irritability without exciting inflammation; these properties, however, although thus dangerous in the distilled water of the laurel and other similar plants, can scarcely be said to exist in any important quantity in the plants in a state of nature. The kernel of the bitter almond, for example, in which the Prussic acid is more abundant than usual, is used for many culinary and other purposes without any bad effect. There are, however, cases in which it is said to be dangerous to eat the fresh leaves or kernel; as in the *Cerasus virginiana*, the leaves and fruit of which are reputed in the United States to be poisonous to certain animals. Besides the Prussic acid, there are several other principles which abound in the order. All *Drupacæ* yield a gum which is nearly allied to gum Arabic, and which affords a strong evidence of the affinity that exists between *Rosacæ* and *Leguminosæ*. A great deal of astringency is found in many species, whence different parts have been occasionally employed as febrifuges, and as remedies for hæmorrhage, diarrhœa, and dysentery. The root of the *Tormentilla* is used for tanning in the Ferro Isles; and that of the *Capollim* cherry in Mexico. The bark of *Cerasus virginiana* is used as a febrifuge in the United States; *Potentilla réptans* has been praised for the same properties. The root of *Gæum urbanum* has been found, by Milandi and Moretti, to contain one eleventh of its weight of tannin; it has been used both in America and Europe as a substitute for Jesuit's bark. The leaves of *Dryas octopétala* in the north of Europe, of *Rubus arcticus* in Norway, of *Prunus spinosa* and *Cerasus avium*, and of *Rosa rubiginosa*, have been manufactured into a sort of substitute for tea. The bark of the root of *Gillenia trifoliata* is remarkable in having, in addition to the astringency already mentioned, an emetic property, on which account it is employed in North America as *Ipæacuanha*. It is said, that a similar power exists in other *Spiracæ*. Cutting, division, and seeds; by grafts, budding, and inarching.

It must not be omitted, that the order *Rosacæ* nearly answers to the *Icosándria* of Linnæus.

202. ORDER LXIX. **CALYCANTHÆÆ**

*Genera* 2, *Species* 8; *Hot-house Species* 0; *Green-house Species* 0; *Hardy Ligneous Species* 8; *Hardy Herbaceous Species* 0. † 21 feet; ‡ 0 feet; ≧ 0 feet.

Beautiful hardy early-flowering shrubs, natives of North America and Japan, with sweet-scented yellowish or lurid purple flowers, which are either axillary or terminal, and simple opposite exstipulate feather-nerved leaves. The wood, leaves, and flowers of *Calycánthus floridus* are sweet-scented, hence it is called American allspice. The order differs from *Rosæcæ* in the form of the embryo, and from *Granátæcæ* in the imbricate aestivation of the calyx; from both, in the absence of petals, and in the numerous divisions of the calyx. Cuttings and layers.

1532 *Calycánthus* *L.* 5 0 | 1534 *Chimonánthus* *Lindl.* 3 0

203. ORDER LXX. **GRANATÆÆ**

*Genus* 1, *Species* 5; *Hot-house Species* 0; *Green-house Species* 1; *Hardy Ligneous Species* 4; *Hardy Herbaceous Species* 0. † 20 feet; ‡ 0 feet; ≧ 0 feet.

This order consists of only one genus, the well-known pomegranate, which is well worth a place in every garden, on account of its beautiful scarlet flowers. It differs from *Myrtæcæ* in the leaves being destitute of pellucid dots, as well as in the seeds being enveloped in pulp; from *Calycántheæ* in the calyx being valvate in aestivation; and from *Memecylæcæ* in the stamens being indefinite. Cuttings, layers, or seeds.

1497 *Púnica* *W.* 4 0

204. ORDER LXXI. **MEMECYLÆÆ**

*Genera* 3, *Species* 4; *Hot-house Species* 4; *Green-house Species* 0; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 0. † 0 feet; ‡ 0 feet; ≧ 0 feet.

Tropical shrubs or trees, with opposite entire smooth exstipulate leaves destitute of dots, axillary or terminal bluish-violet or white flowers, and edible fruit. It is a very doubtful order. Cuttings.

1195 *Memécylon* *L.* | 3346 *Mouriria* *J.* | 1364 *Petalöma* *Suz.*

205. ORDER LXXII. **COMBRETACEÆ**

*Genera* 7, *Species* 39; *Hot-house Species* 37; *Green-house Species* 2; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 0. † 0 feet; ‡ 0 feet; ≧ 0 feet.

*Combrétum* and *Quisquális* are among the most splendid of the climbing plants of the tropics, adorning the trees from which they depend with garlands of white and crimson, and yellow. The bark of *Bucida Buceras* is used with success in Guiana for tanning leather. The juice of *Terminalia vérmix* is employed by the Chinese as a varnish; it is, however, caustic, and its exhalation dangerous; benzoin is the produce of *Terminalia Benzóin*. The kernel of several species is eaten as a nut, and the expressed oil has the remarkable quality of not becoming rancid. Cuttings.

206. Tribe 1. **TERMINALIÆÆ**

1367 *Bucida* *L.*  
2864 *Terminalia* *L.*  
1354 *Getónia* *Rox.*  
3347 *Poirrea* *Com.*

713 *Conocárpus* *Jac.*

207. Tribe 2. **COMBRETÆÆ**

1203 *Combrétum* *L.*  
1355 *Quisquális* *L.*

208. ORDER LXXIII. **VOCHYSIÆÆ**

*Genus* 1, *Species* 1; *Hot-house Species* 1; *Green-house Species* 0; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 0. † 0 feet; ‡ 0 feet; ≧ 0 feet.

Fine trees and shrubs, natives of tropical America, with terminal paniced or thyrsoid racemes of yellow flowers, and opposite or whorled entire feather-nerved leaves, each furnished with two stipulas at the base. This order agrees with *Combrétæcæ* in having convolute cotyledons and inverted seeds, and with *Onagrariæcæ*, particularly with the genus *Lopezia*, in the flowers being monandrous, or, if triandrous, two of the anthers are always sterile. Cuttings.

21 *Vochysia* *Poir.*

209. ORDER LXXIV. **RHIZOPHOREÆÆ**

*Genera* 2, *Species* 2; *Hot-house Species* 2; *Green-house Species* 0; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 0. † 0 feet; ‡ 0 feet; ≧ 0 feet.

The mangroves are plants of arborescent stature, which are remarkable, in tropical countries, for growing upon the shores of the sea and rivers, even as far as low water. The seeds have the singular property of germinating, while enclosed within the capsule and adhering to their parent, and pushing forth a long fusiform radicle, which lengthens till it reaches the soil, where it takes root, and forms a new individual. The bark of *Rhizophora gymnorhiza*, which is very astringent, is used in India for dyeing black. Cuttings.

1428 *Rhizophora* *L.* | 1430 *Carália* *Rox.*

210. ORDER LXXV. **LOPHIÆÆ**

*Genus* 1, *Species* 1; *Hot-house Species* 1; *Green-house Species* 0; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 0. † 0 feet; ‡ 0 feet; ≧ 0 feet.

A very doubtful order, containing only one genus. A beautiful shrub, native of Sierra Leone, with terminal corymbs of white flowers, and a one-leaved permanent calyx. Leaves long, entire, and coriaceous. Seeds.

1504 *Lophira* *Banks*

211. ORDER LXXVI. **ONAGRARIÆÆ**

*Genera* 14, *Species* 146; *Hot-house Species* 15; *Green-house Species* 32; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 99. † 0 feet; ‡ 22½ feet; ≧ 3 feet.

A very well defined order, generally known by its pollen cohering, by a sort of filamentous substance, an inferior polyspermous ovary, a tetrasepalous tetrapetalous flower, with a definite number of stamens, and

a single style. From this form there are some anomalous variations, such as *Circæa* and *Lopèzia*, which are, however, easily reconciled to the usual structure of the order. Most of the genera are preeminently beautiful; as *Epilobium*, *Ænothëra*, and *Fuchsia*, which are old favorites among gardeners. The properties of *Onagraceæ* are little known, and probably very weak. The leaves of *Jussiaëa peruviana* are used as an emollient poultice, the seed of *Tripha natans* as an eatable nut, and the root of *Ænothëra biennis* as a sort of salad. Cuttings and seeds.

## 222. ORDER LXXVIII. CERATOPHYLLÆÆ.

*Genus 1, Species 2; Hot-house Species 0; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 2. ♀ 0 feet; ♂ 0 feet; ♂ 3 feet.*

Aquatic plants, with the habit of *Myriophyllum*. The order consists only of *Ceratophyllum*, which contains two species, both natives of lakes and ditches in Britain. Seeds.

2651 *Ceratophyllum* L. \*0 2

## 223. ORDER LXXIX. LYTHRARIÆÆ or SALICARIÆÆ.

*Genera 11, Species 61; Hot-house Species 23; Green-house Species 13; Hardy Ligneous Species 0; Hardy Herbaceous Species 25. ♀ 0 feet; ♂ 10½ ft.; ♂ 1 foot.*

Most of these are very showy plants, in particular the genera *Lythrum* and *Lagerstrœmia*, which are the representatives of the order. They are chiefly natives of temperate climates, on mountains and among bushes. *Pêplis* is a common bog plant in England. *Hemîa* is remarkable for its yellow flowers. Little is known of the properties of *Salicaria*; they are mostly astringent; the common *Salicaria* is used in inveterate diarrhœas; a species of *Lythrum* is used in Mexico as a vulnerary and astringent; and *Lawsonia*, which is used by the Turkish women to stain their nails, is also supposed to possess similar properties. There is a plant of this order called *Hanchinol* in Mexico, which is said to possess much more remarkable powers than any of the preceding; its expressed juice, taken in doses of four ounces, excites violent perspiration and secretion of urine, and is said to cure venereal disorders in an incredibly short space of time. Cutting, division, and seeds.

## 226. ORDER LXXX. TAMARISCINÆÆ.

*Genus 1, Species 6; Hot-house Species 3; Green-house Species 0; Hardy Ligneous Species 3; Hardy Herbaceous Species 0. ♀ 17½ ft.; ♂ 0 feet; ♂ 0 feet.*

Shrubs, rarely herbs, with twigg branches, small entire scale-like leaves which are usually glaucous, and small white or rose-coloured flowers which are disposed in spikes or racemose spikes. This order differs from *Onagraceæ* in the ovary being free, and in the imbricate aestivation of the calyx; and from *Lythrarieæ* in the petals being inserted at the bottom of the calyx, as well as in its aestivation. The species are natives of Europe, Asia, and Africa. Some of the kinds of *Tamarix* have an astringent tonic bark, and yield, when burnt, a large proportion of sulphate of soda. Cuttings.

899 *Tamarix* L. \*3 0

## 227. ORDER LXXXI. MELASTOMAÆÆ.

*Genera 12, Species 76; Hot-house Species 69; Green-house Species 3; Hardy Ligneous Species 0; Hardy Herbaceous Species 4. ♀ 0 feet; ♂ 2 feet; ♂ 0 feet.*

All these are remarkable as handsome tropical shrubs or trees, with large purple or white flowers, and leaves with several costæ, or nerves as they are incorrectly termed. The genera admitted in the body of the work are those received by the greater part of previous writers; they have been much increased, and apparently with great propriety, by Mr. D. Don. The species are generally ill treated in collections, where they are not unfrequently to be found under the form of sickly stunted plants, instead of noble broad-leaved spreading shrubs, with masses of brilliant flowers. To be grown well they require much heat, much moisture during the summer, and much pit-room and head-room. The fruit of true *Melastomas* is a fleshy insipid juicy berry, which is for the most part eatable, and is often so deep a black as to dye the teeth and mouths of those who eat it. They are nearly related to *Myrtacææ*, from which they differ in the want of essential oil, and of the dot-like reservoirs of the leaves which contain it. The juice of the leaves of *Micònia succosa* and *alata* is used as a lotion for recent wounds by the inhabitants of Guiana. Cuttings and seeds.

232. ORDER LXXXII. **ALANGIE'ÆÆ.**

*Genera 1, Species 2; Hot-house Species 2; Green-house Species 0; Hardy Lignous Species 0; Hardy Herbaceous Species 0. 2 3½ ft.; 2 0 feet; 2 0 feet.*

Shrubby trees, natives of India, with the branches usually spinescent, alternate exstipulate ovate-lanceolate, acuminate feather-nerved quite entire leaves, and the flowers which are white rising in fascicles from the axilla of the leaves; the fruit is edible. The order only consists of one genus, it differs from Myrtaceæ in the petals being more numerous and in the anthers being adnate, as well as in the fruit being one-celled. Cuttings.

1494 *Alangium* J.

233. ORDER LXXXIII. **PHILADELPHIE'ÆÆ.**

*Genera 2, Species 18; Hot-house Species 0; Green-house Species 0; Hardy Lignous Species 18; Hardy Herbaceous Species 0. 2 7 feet; 2 0 feet; 2 0 feet.*

This consists at present of a single genus, which was formerly referred to Myrtaceæ, but which has lately been separated with much acuteness by Mr. Don. The species are hardy ornamental shrubs, natives of North America, with white flowers; in some cases fragrant. Nothing is known of their properties. Cuttings and layers.

1479 *Philadelphus* L. 15 0 | 1433 *Decumaria* L. 3 0

234. ORDER LXXXIV. **MYRTACE'ÆÆ.**

*Genera 57, Species 223; Hot-house Species 55; Green-house Species 208; Hardy Lignous Species 0; Hardy Herbaceous Species 0. 2 0 feet; 2 0 feet; 2 0 feet.*

Dotted leaves with marginal ribs, and an inferior ovary and single style, are the great features of Myrtaceæ. They are all fine evergreen shrubs or trees, generally bearing white flowers, and in the first section producing fleshy fruit. It is there that the Allspice, the Clove, the Rose-apple, and the Guava find their station, by the side of the common myrtle. The section with capsular fruit comprehends, with the exception of the gigantic Eucalyptuses, almost wholly handsome hard-wooded New Holland or South Sea shrubs, with white or crimson flowers and stamens: yellow flowers are very uncommon. The volatile oil contained in the little reservoirs of the bark, the leaves, and the floral envelopes, gives these plants the fragrance which has caused them to be celebrated by poets of all ages. It is very aromatic, a little acid, and slightly tonic and stimulant, whether it is under the form of Capeputi oil, the produce of *Melaleuca Leucadendron*, or of oil of cloves or of myrtle. In the clove this oil is so abundant as to constitute nearly a fifth of the whole weight of the calyxes that produce it. There is also a considerable proportion of astringent principle in these plants; in the bark of *Myrtus Uguai* and multiflora of Chile, and *Jambosia malaccensis*, it is so abundant as to render a decoction of those plants of great use in cases of dysentery. Eucalyptus resinifera produces an astringent subresinous substance resembling gum kino. The leaves of the Chilian myrtles, *Leptospermum scoparium*, and some other species, have been used as substitutes for tea. Cuttings and seeds.

243. ORDER LXXXV. **CUCURBITACE'ÆÆ.**

*Genera 18, Species 123; Hot-house Species 27; Green-house Species 54; Hardy Lignous Species 0; Hardy Herbaceous Species 42. 2 0 feet; 2 4½ ft.; 2 0 feet.*

Here is the station of the gourd, the melon, and the cucumber, succulent climbing vegetables, the fruit of which administers to us many of our comforts and necessities. The importance of the gourd in hot countries is of the highest degree, where, from the nature of the climate, few of these culinary vegetables that are so abundant in the north can be made to succeed. Among these tribes of climbing annuals, the papaw tree is a remarkable deviation from the ordinary character of the vegetation. Its fruit, however, and flowers are in all respects those of Cucurbitaceæ. The fruit is mostly sweet, watery, refreshing, and pleasant to the palate; but the coloquintida gourd, the spirting cucumber, and the *Trichosanthes amara*, are all possessed of violent bitter, drastic, purgative qualities, which are, indeed, to be found, in a slight degree, even in the mildest of the edible gourds. M. Decandolle observes, that as the violent action of the Colocynth resin is much softened by the mixture with it of gum, it is probable that the difference in the fruits of the order depends upon the different proportions between these two substances. The seeds of the gourd, like those of the passion-flower, possess none of the properties of the pulp; they are sweet and nutty, and readily form an emulsion. The roots of the bryony are purgative, but also contain a wholesome fecula. It is said that the roots of a species of bryony are eaten in Abyssinia, after being merely boiled. There are some Cucurbitaceæ, the roots of which are intensely bitter; those of one of this description are used in Peru, to remove the pains attendant upon inveterate venereal disorders. Seeds.

## 241. ORDER LXXXVI. PASSIFLOREÆ.

Genera 6, Species 83; Hot-house Species 75; Green-house Species 5; Hardy Lignaceous Species 3; Hardy Herbaceous Species 0.  $\uparrow$  3½ feet;  $\downarrow$  0 feet;  $\pm$  0 feet.

The beauty of Passifloras is well known; they are remarkable for the singular arrangement of the stamens and pistillum, upon a column surrounded by several lines of circumvallation, formed by as many rows of barren thread-like colored stamens, which are popularly called the rays. The fruit of several species of passion-flower is filled with pleasant acidulated pulp, on which account they are eaten as dessert fruit. It is not known that they possess any medical properties. The station of the order is not settled; it is undoubtedly very near Cucurbitaceæ. Cuttings and seeds.

## 248. ORDER LXXXVIII. TURNERIAÆ.

Genera 1, Species 12; Hot-house Species 10; Green-house Species 0; Hardy Lignaceous Species 0; Hardy Herbaceous Species 2.  $\uparrow$  0 feet;  $\downarrow$  3 feet;  $\pm$  0 feet.

This order consists only of two genera, *Turneria* and *Pariputia*; they are small suffruticose or herbaceous plants, chiefly natives of tropical America, with alternate exstipulate leaves, and axillary yellow flowers, equalling those of *Helianthemum*. The order is chiefly distinguished from *Loasæ* in the stamens being equal in number with the petals, and inserted at the bottom of the calyx, not in the throat of the tube as in that order. Cuttings or seeds.

900 *Turneria* L. 0 2

## 249. ORDER LXXXIX. PORTULACÆÆ.

Genera 10, Species 55; Hot-house Species 21; Green-house Species 14; Hardy Lignaceous Species 0; Hardy Herbaceous Species 20.  $\uparrow$  0 feet;  $\downarrow$  5 feet;  $\pm$  1½ feet.

With the exception of *Tallium* and *Calandrinia*, and a few species of *Claytonia*, the whole of this order consists of insignificant weedy plants, of no beauty, and little use. *Claytonia perfoliata* and common purslane, which are occasionally used as salads, being the only species of a useful kind. They are chiefly herbaceous plants, frequenting dry barren situations, or the sea-shore of all parts of the world; all are insipid and inodorous, and destitute, as far as is known, of medicinal properties. Cuttings and seeds.

## 250. ORDER XC. PARONYCHIEÆ.

Genera 16, Species 58; Hot-house Species 5; Green-house Species 15; Hardy Lignaceous Species 1; Hardy Herbaceous Species 37.  $\uparrow$  1 foot;  $\downarrow$  6½ feet;  $\pm$  1 foot.

This order consists chiefly of small insignificant weedy, herbaceous, or suffruticose plants, with the exception of *Corrigiola*, *Telphium*, *Illicium*, and a few species of *Lahaya*. The flowers are small, white or greenish-white, sometimes axillary and sometimes disposed in terminal cymes, the leaves are small and entire. The order differs from *Portulacæ* in the stamens being opposite the lobes of the calyx, not alternate with them. Cuttings and seeds.

|                                                                            |                                             |                                            |                         |   |   |

## 257. ORDER XCI. CRASSULACEÆ.

Genera 22, Species 263; Hot-house Species 8; Green-house Species 168; Hardy Lignaceous Species 0; Hardy Herbaceous Species 87.  $\uparrow$  0 feet;  $\downarrow$  13 feet;  $\pm$  1½ feet.

Herbs or small shrubs with fleshy leaves, and beautiful red, orange, yellow, or white flowers. Natives of all parts of the world. The order is chiefly distinguished from *Ficoideæ* in the embryo being straight, not curved. Cuttings, seeds, sometimes by division.

|                                                            |                             |                                            |   |

## 260. ORDER XCII. FICOIDEÆ.

Genera 8, Species 443; Hot-house Species 5; Green-house Species 432; Hardy Lignaceous Species 3; Hardy Herbaceous Species 3.  $\uparrow$  3½ feet;  $\downarrow$  3 feet;  $\pm$  0 feet.

These are all plants with a greater or less degree of succulence; the *Mesembryanthemums* and *Hymenogone* are well-known dry-stove plants, many of which are beautiful in the highest degree. Of the forme:

of these two, the flowers are of all colors, many of the most vivid hues, and remarkable for expanding only beneath bright sunshine; this phenomenon, indeed, is common to the whole order. *Tetragonia expansa*, *Sesivium Portulacastrum*, and *Mesembryanthemum edule*, are excellent substitutes for summer spinach. A large quantity of saline matter is contained in all of them; in *Reaumuria vermiculata* a substance is secreted, which has been found by chemical analysis to consist of muriate of soda and nitrate of potash. The whole order grows in very dry or saline places, in the temperate regions of the world. Four fifths of the whole are natives of the Cape of Good Hope. The leaves of the different species of *Mesembryanthemum* offer the most remarkable instances of figure known in the vegetable world. Cuttings, offsets, division, or seeds.

263. ORDER XCIII. CA'CTEÆ or OPUNTIA'CEÆ.

Genera 9, Species 156; Hot-house Species 155; Green-house Species 1; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

All succulent plants destitute for the most part of leaves, the place of which is supplied by fleshy stems of the most grotesque figure; some angular, and attaining the height of thirty feet, others roundish, covered with stiff spines, like the hedgehog, and not exceeding the stature of a few inches. Their flowers are in many cases large and remarkably specious, varying from pure white to rich scarlet and purple, through all the intermediate gradations of colors. The species are chiefly natives of the hottest and driest parts of the tropics, and are cultivable with little care, in pots filled with rubbish, in a dry-stove. Their fruit is fleshy and watery, and generally insipid, but it is eaten in their native countries for the sake of its refreshing moisture and coolness. Two species of *Opuntia* are hardy in Great Britain. The characters of this order and the next are very similar, although their habit is so widely different. Cacti are sometimes called *Nopálæm*. Cuttings, offsets, or seeds.

266. ORDER XCIV. GROSSULARIÆ.

Genus 1, Species 49; Hot-house Species 0; Green-house Species 1; Hardy Ligneous Species 48; Hardy Herbaceous Species 0. ♀ 34 feet; ♂ 0 feet; ± 0 feet.

Distinguished from the last by the definite number of their stamens and woody leafy stems. The utility and excellence of the gooseberry and currant are known to every one. None of the other species equal these, although the fruit of several possesses considerable excellence. The berry of most of these is sweet, watery, and acid, but that of *Ribes nigrum*, and a few more, is tonic and stimulant, which appears to have some connection with the presence of glands upon the leaves of those species. Cuttings or seeds.

267. ORDER XCV. ESCALLO'NIÆ.

Genus 1, Species 5; Hot-house Species 2; Green-house Species 3; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Beautiful evergreen shrubs, natives of Chile, with the habit of *Andrœmeda*, and which probably should be arranged near it, with terminal racemes of small white or red flowers. Nothing is known of their properties. Cuttings and seeds.

|                            |

268. ORDER XCVI. SAXIFRA'GEÆ.

Genera 10, Species 142; Hot-house Species 0; Green-house Species 5; Hardy Ligneous Species 6; Hardy Herbaceous Species 131. ♀ 15½ ft.; ♂ 17½ ft.; ± 0 feet.

The whole of these plants constitute the glory and delight of the cultivator of alpine plants. This is to be attributed to the neatness and perpetual verdure of their leaves, and the exquisite simplicity and elegance of their flowers, rather than to any striking attractions, of which they are wholly destitute; their blossoms being generally white or pale pink, occasionally becoming brownish-purple. All the genuine species are humble herbaceous plants, affecting mountainous situations, but occasionally found in marshes by the sides of springs, and even upon dry walls. All are natives of cold regions, or of the most temperate mountainous situations of hot ones. They are slightly astringent; some of them, as *Heuchera americana*, eminently so. Infusions of the leaves have been reckoned lithontriptic, and the powdered root of the last-named plant is used with success in cancerous disorders. *Hydrangea*, which is shrubby, is not a legitimate inhabitant of the order. Cuttings, division, or seeds.

|                          |    |     |                               |    |   |                          |    |   |

269. ORDER XCVII. CUNONIA'CEÆ.

Genera 5, Species 10; Hot-house Species 5; Green-house Species 5; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

These were formerly included in *Saxifragææ*, from which Mr. Brown first distinguished them. They are shrubs of the southern hemisphere, mostly with pinnated leaves and white or red flowers. *Callicoma* and *Bauera*, which have simple leaves, are elegant green-house shrubs. The bark of a species of *Weinmannia* is employed in Peru for tanning leather, and is said to be also used for adulterating the quinquina. Nothing is known of the properties of the remainder. Cuttings.

270. ORDER XCVIII. UMBELLIFERÆ.

Genera 101, Species 570; Hot-house Species 11; Green-house Species 48; Hardy Ligneous Species 1; Hardy Herbaceous Species 510. ♀ 3 feet; ♂ 57 feet; ± 0 feet.

One of the least attractive groups of plants, and at the same time one of the most important to the world. They are not more useful as food than they are dangerous as poison; while in their native ditches they are often suspiciously lurid weeds, but under the influence of cultivation they lay aside their venom, and become wholesome food for man. They are generally recognised by their hollow stems and cut leaves, with what botanists call a sheathing petiole; that is to say, with a petiole, the base of which wraps round the stem. Their flowers are mostly white or yellow; rarely, as in *Astrantia*, some species of *Caucalis*, and others, of a pink color; or blue, as *Eryngium*. The inflorescence is umbellate, and their fruit consists of two ribbed portions, improperly called seeds, which are held together by a common axis, and a thickened diacus. All are

natives of damp ditches or way-sides, in cool parts of the world; in the tropics they are extremely rare. The simplicity of their structure, and uniformity of their appearance, have rendered their classification a matter of very great difficulty. It has been attempted in modern days by Sprengel, Lagasca, Koch, and Descaudolle, all of whom have added much to our knowledge. The arrangement of Koch and Descaudolle is here adopted as the most perfect, upon the whole, of any yet published. The culinary and agricultural importance of many species is well known; the parsnep and carrot form a large part of the staple winter store of the inhabitants of Europe, as the Arracacha do of those of South America; and the Tragus of Tibet is supposed to be the most important and productive of any in the whole world, as a forage plant. The medicinal properties of Umbelliferae are not more powerful than they are at variance with each other. While the seeds of some are aromatic, and stimulating in the highest degree, the fresh roots and leaves of others are not less narcotic. This has been supposed to arise from the difference in the state of the sap in different parts of the plant; and it has been thought that the narcotic principle is only to be found in the ascending sap, while the aromatic stimulant properties are found in the juices, which are fully elaborated and matured. It has been already observed, that their dangerous properties are often removed by cultivation; the common celery is a familiar instance of this; but the most remarkable, that of *Enánthe pimpinellodes*, a most dangerous species when wild, which is cultivated about Angers for the sake of its roots, which are there called *Jonanettes*, and about Saumur, where they are known by the name of *Méchons*. The roots of some Umbelliferae contain a large proportion of sugar; those of the carrot, when dried, more than an eighth; those of the parsnep just an eighth; and those of the chervil about eight parts in 100. Galbanum, Opopanax, and Assafoetida, are all the produce of different species of Umbelliferae. Division of seeds, sometimes by cuttings.

|                                                                                                 |                                                                          |                                                                  |                           |                                                              |

## 291. ORDER XCIX. ARALIA`CEÆ.

Genera 7, Species 43; Hot-house Species 26; Green-house Species 5; Hardy Ligneous Species 7; Hardy Herbaceous Species 5. £ 15 feet; £ 6 feet; £ 3 feet.

Araliæce are a slight divergence from the well-known Umbellifera, with which they nearly agree in habit, except in being usually frutescent, and from which they are obviously distinguished by their 5-celled fruit. Their flowers have no beauty, but the foliage of many is extremely fine, especially of the species of *Sciodaphyllum*; that of our common ivy must not be omitted. Their medicinal properties are much the same as those of Umbelliferae, except the fruit, which differs in virtues as it does in botanical structure. Their bark exudes an aromatic gum resin, as in *Aralia umbellifera*. Their roots are tonic, with, in some cases, the flavor of parsnep. The famous ginseng, which is produced by a *Panax*, is reputed to have powerful tonic, restorative, and even aphrodisiacal qualities; but it is probable that these have been greatly exaggerated. Cuttings, layers, roots; some by division.

292. ORDER C. CAPRIFOLIA'CEÆ.

Genera 11, Species 118; Hot-house Species 3; Green-house Species 10; Hardy Ligneous Species 96; Hardy Herbaceous Species 9. † 72 feet; ‡ 7 feet; ± 0 feet.

This is an eminently beautiful order, consisting either of twining or erect shrubs with clusters of trumpet-shaped fragrant white, scarlet, or yellow, flowers, or of fine bushes having cymes of white blossoms. The honey-suckle is the representative of the former, the dogwood of the latter. Here too is found the modest and delicate *Linnaea*, which, however inferior its attractions for the vulgar eye may be to those of its more ostentatious neighbours, yields to none of them in elegance or interest for the botanist. All the genera have a more or less astrin-gent bark; that of *Lonicera corymbosa* is used in Chile for dyeing black; that of *Cornus florida* in North America in intermittent fevers, as is also the bark of *Cornus sericea*, which, according to Barton, is scarcely inferior to Quinquina. The Elders are the link between honeysuckles and umbelliferous plants, to the latter of which they are allied by their stinking divided foliage and half herbaceous habit; their flowers are sudorific and soporific in a high degree, their leaves and inner bark are emetics and drastic purgatives. *Triosteum perfoliatum* is intermediate between this order and Rubiaceæ, with the former of which it agrees in its purgative, and with the latter in its emetic, qualities, which resemble those of ipecacuanha. All Caprifoliaceæ love shady cool places in both hemispheres; but few have been found in such as endure a very severe climate. Cuttings, layers, or seeds.

293. ORDER CL. LORANTHEÆ.

Genera 2, Species 2; Hot-house Species 0; Green-house Species 0; Hardy Ligneous Species 2; Hardy Herbaceous Species 0. † 2 feet; ‡ 10 feet; ± 0 feet.

None of these are cultivable; they are all genuine parasites, rooting beneath the bark of the trees on which they grow, and deriving from their juices the whole of their nutriment. The *Viscum* has little or no beauty, but the *Loranthi* are among the most lovely of plants, hanging in clusters of rich scarlet flowers from the branches of trees in the tropics, which they often clothe with a beauty not their own. The mistletoe of the Druids is supposed to have been the *Loranthus europæus*, the common *Fiscum* never being seen upon the oak, while the *Loranthus* inhabits no other tree. If this be so, the latter must have once existed in this kingdom although now extinct. It has been suggested, that all vestiges of their religion were extirpated with the Druids, which will account for the *Loranthus* having disappeared wherever that religion formerly held its sway. Seeds.

294. ORDER CII. CHLORANTHEÆ.

Genus 1, Species 3; Hot-house Species 3; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. † 0 feet; ‡ 0 feet; ± 0 feet.

Small inconspicuous shrubs with terminal spikes of green flowers, wholly destitute of interest for gardens. Cuttings or suckers.

26 *Chloranthus Swt.*

295. ORDER CIII. RUBIA'CEÆ.

Genera 73, Species 387; Hot-house Species 221; Green-house Species 34; Hardy Ligneous Species 3; Hardy Herbaceous Species 129. † 1½ ft.; ‡ 19 feet; ± 0 feet.

Opposite entire leaves with intervening stipule, a monopetalous superior corolla, with a definite number of stamens and a bilocular ovary, are the great characteristics of Rubiaceæ; an order of such extent that it embraces a very large proportion of the whole of phanogamous plants, including within its limits humble weeds and lofty trees, plants with important medicinal qualities and flowers of varied dyes. The sections into which the order has been divided are merely artificial, with the exception of Spermacœceæ, Galeæ, and Cephalanthæ, which are the representatives of the order in northern regions. Among these the *Rubia*, or madder, is the most important on account of its dye; *Galium* also possesses some qualities of minor consequence. Among the other sections, the plants of beauty or value are innumerable: of the former description, the genera *Ixora*, *Bouvardia*, *Catesbea*, *Portlandia*, *Coutarea*, *Gardenia*, *Mussaenda*, *Hamellia*, *Cephaelis*, *Cephalanthus*, and many others, are notable examples; to the latter, every genus has a contribution of one kind or another. The root of *Hedyotis umbellata* is employed in India for staining nankin; that of *Morinda umbellata* in the Moluccas, and of *Morinda citrifolia* in India, is used for dyeing red and brown. The potent febrifugal properties of the *Cinchona* need not be insisted on; it is less generally known that the bark of *Pinckneya pubens*, *Macrocnemum corymbosum*, *Isertia coccinea*, and *Portlandia grandiflora*, possesses similar, but weaker, powers. The bark and roots of *Antirrhoea* are used, in the Isle of Bourbon, to stop hæmorrhage; and that of *Morinda Royoc* is used for ink. Astringent properties of a very marked character are found in the juice of *Nauclea Gambir* of Hunter, the *Uncaria Gambir* of Roxburgh, which is often improperly confounded with Gum kino, the produce of a very different plant. Some of the species formerly comprehended under the genus *Cinchona*, but since separated by the name of *Exostemma*, possess strong emetic powers. The same qualities exist in *Cephaelis emetica*, the *Callicocca Ipecacuanha*, and *Geophila reniformis*, which are often used as ipecacuanha. The seed of the *Coffea* furnishes the valuable beverage which is so much esteemed in Europe and the East, under the name of coffee. Division, seeds, or cuttings.

## 305. ORDER CIV. OPERCULARIÆÆ.

*Genera* 2, *Species* 6; *Hot-house Species* 1; *Green-house Species* 5; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 0. ♂ 0 feet; ♀ 0 feet; ± 0 feet.

Exotic weeds, nearly related to Rubiæcæ. Their properties are unknown. M. de Jussieu has remarked that their affinity to Valerianææ is supported by the curious circumstance, that birds devour the young shoots of the Opercularias as they do those of the corn-salads. Seeds or cuttings.

328 *Opercularia* L. | 329 *Cryptospermum* Pers.

## 306. ORDER CV. VALERIANÆÆ.

*Genera* 5, *Species* 50; *Hot-house Species* 0; *Green-house Species* 1; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 49. ♂ 0 feet; ♀ 13½ ft.; ± 0 feet.

Small herbaceous plants, more interesting for the sake of their symmetry and neatness, than on account of any particular attractions: they may be considered a connecting link between Rubiæcæ and Dipsacææ. Many of the Valerians, and all the Patrínias, are pretty plants. The Valerianellas are useful esculents, known under the name of corn-salads. Their medicinal properties are of a decisive character. The roots of *Valeriana officinalis*, *Phù*, and others, are bitter, tonic, aromatic, antispasmodic, and vermifugal; they are occasionally used as febrifuges. The odor of Valerian is not generally agreeable, but the Orientals collect with care, on the mountains of Austria, the roots of *Valeriana celtica*, with which they perfume their baths; and the natives of India, at this day, employ the *Valeriana jatamansi*, the spikenard of old times, as a perfume, and against hysterics and epilepsy. Division or seeds.

20 *Centranthus* Dec. \*0 4 | 330 *Patrinia* J. 0 7 | 96 *Valerianella* Duf. \*0 18  
95 *Valeriana* L. \*0 19 | 86 *Fedia* Moen. 0 1

## 307. ORDER CVI. DIPSACÆÆ.

*Genera* 8, *Species* 108; *Hot-house Species* 0; *Green-house Species* 9; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 99. ♂ 0 feet; ♀ 25½ feet; ± 0 feet.

Very nearly akin to Compositæ, of which they have nearly the habit. All are herbaceous plants with flowers growing in heads. Some of the Scabiosas and Asterocephalus are very handsome, and popular border flowers. The whole tribe is cultivated with great facility. Some of the species of Scabiosa have been employed as diaphoretic and antisiphilitic, but are now neglected. Division or seeds.

84 *Morina* L. | 3388 *Succisa* Vail. \*0 15 | 345 *Cephalaria* Schr.  
344 *Dipsacus* L. \*0 7 | 3289 *Asterocephalus* Vail. \*0 53 | 347 *Knaütia* L. 0 2  
346 *Scabiosa* Vail. \*0 17 | 3290 *Pteroccephalus* Vail. 0 5

## 308. ORDER CVII. CALYCEÆÆ.

*Genus* 1, *Species* 1; *Hot-house Species* 1; *Green-house Species* 0; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 0. ♂ 0 feet; ♀ 0 feet; ± 0 feet.

Obscure weedy South American plants, differing from Compositæ chiefly in the position of their ovula. Seeds or cuttings.

2459 *Acicárpha* J.

## 309. ORDER CVIII. COMPOSITÆÆ.

*Genera* 296, *Species* 2771; *Hot-house Species* 181; *Green-house Species* 609; *Hardy Ligneous Species* 25; *Hardy Herbaceous Species* 1956. ♂ 19½ ft.; ♀ 108 feet; ± 0 feet.

A most extensive and natural order, obviously characterised by the cohesion of their antheræ, and the arrangement of their florets in involucreated heads, or calathidia, as they are now called. Most of them may be said to be ornamental plants, and yet but a very few hold that station in the opinion of the public. It is difficult to account for this circumstance, nor is this the place to enter upon such an investigation; certain, however, it is, that with the exception of georginas, the varieties of *Chrysanthemum sinense*, and a few *Calendulas* and *Arctotises*, and perhaps *Tagetes*, scarcely a single Composita now finds a place in a fashionable flower-garden. The prevailing colour of the flower in the order is yellow; red, purple, or scarlet being comparatively uncommon. The species inhabit every part of the world, and in all, perhaps, in nearly equal proportions: in Europe and the north of the world they are chiefly herbaceous; but within the tropics, they are more frequently frutescent. Their medical properties are very important: *Tussilago Færfara*, *Chamomile*, *Inula*, *Solidago*, *Virgaurea*, *Matricaria*, *Parthenium*, *Stèvia* febrifuga, and *Eupatorium perfoliatum* are instances of the presence of tonic and febrifugal properties; *Tanacetum* and *Santolina* are anthelmintic; *Matricaria* and the *Achilleas* emmenagogue; some *Eupatoriums*, *Achilleas*, *Artemisias*, and *Calendulas* are sudorific; certain *Liatris* are diuretic, and *Erigeron philadelphicus* is both sudorific and diuretic. *Ptarmica* and *Arnica* are sternutatory, and *Spilánthes*, *Siegesbeckia orientalis*, *A'nthemis Pyrethrum*, and others, powerfully excite salivation; finally, many *Achilleas*, *Chamomile*, *Tanacetum*, and *Eupatoriums* are tonic and antispasmodic. Others seem to possess all these properties combined, and are reckoned among the best alexiterics, as the *Ayapana* of Brazil, and the *Guaco* of Peru. Every one knows the excellent and refreshing flavour communicated to vinegar by Tarragon: the same effects are produced in the Alps by *Achilla nana*, *Artemisia glacialis*, *rup'istris*, and *spicata*. Some species of *Achilla*, *Bellis*, and *Artemisia* have been used as substitutes for tea. The seeds of many Compositæ, as *Madia* and *Verbesina*, yield a copious oil;

and the fleshy roots of *Helianthus tuberosus*, a wholesome food for man. The juice of *Lactuca viridis* is highly narcotic, and has been even employed with extraordinary advantage as a substitute for opium. It is not necessary to mention the utility of the leaves of the lettuce, the endive, the succory, the cardoon, or the roots of *Scorzonera* and *Salsafia*, as culinary productions; they must be familiar to all our readers; as also the fleshy receptacle of the artichoke and some other plants. The flowers of *Echinops viridis* are used as a kind of tincture; those of the artichoke, the cardoon, and others, have the power of curdling milk. The arrangement of Composite is attended with extreme difficulty; the greatest progress that has yet been made in reducing them to order has been by M. Cassini, and Mr. D. Don in the *Linnean Transactions*, vol. xvi. Division, seeds, and sometimes by cuttings.

## 330. ORDER CIX. LOBELIA'CEÆ.

Genera 5, Species 90; Hot-house Species 8; Green-house Species 62; Hardy Ligneous Species 0; Hardy Herbaceous Species 20. ↑ 0 feet; ↓ 9 feet; ± 2 feet.

Very ornamental herbaceous plants, with blue, white, or scarlet flowers. The anthers are of the same structure as those of *Composita*. The juice of some of the *Lobelias* is highly caustic and inflammatory; when taken internally, producing vomiting, and even death; nevertheless, the root of *Lobelia siphilitica*, in small doses, acts as a diaphoretic; in greater quantity, as diuretic or purgative; and, if taken in a considerable quantity, as an emetic. An infusion of *Lobelia inflata* is used in North America as a remedy for leucorrhœa; and the root of *Lobelia cardinalis* is employed in the same country as a vermifuge. Seeds, division.

|                          |    |    |                               |   |   |                        |

## 331. ORDER CX. STYLIDÆÆ.

Genus 1, Species 6; Hot-house Species 0; Green-house Species 6; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ↑ 0 feet; ↓ 0 feet; ± 0 feet.

Like the last, the properties of this very small but curious order are, if any, undiscovered. All are inhabitants of New Holland, and either herbs or half-herbaceous shrubs. They have pink flowers, ornamented with glittering glands; their stamens are united into a column, which is terminated by a sessile stigma, and which is irritable in so high a degree, that, if touched with a pin, it instantly starts from its place with great elasticity. Cuttings, seeds.

2581 *Stylidium Swz.*

## 332. ORDER CXI. GOODENO'VIÆ.

Genera 5, Species 21; Hot-house Species 3; Green-house Species 18; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ↑ 0 feet; ↓ 0 feet; ± 0 feet.

New Holland and South Sea herbs or undershrubs, very nearly akin to the last, from which they differ more in artificial characters than in habit. All of them are pretty, and deserving culture. Nothing is known of their properties. Cuttings, division, or seeds.

|                            |  |  |                           |  |  |                            |

## 333. ORDER CXII. CAMPANULA'CEÆ.

Genera 11, Species 222; Hot-house Species 1; Green-house Species 33; Hardy Ligneous Species 0; Hardy Herbaceous Species 188. ↑ 0 feet; ↓ 30½ feet; ± 0 feet.

These differ from *Composita* in not having the flowers in heads, in their usually distinct anthers, in their polyspermous fruit, and also in exuding a milky juice. All the genera are pretty, and some highly ornamental. They are mostly herbaceous, and by far the greater number are extra-tropical, abounding especially in the woods and coppices of the north. The roots of *Campánula Rapunculus* are used as a vegetable under the name of Rampion. Cuttings, division, and seeds.

## 334. ORDER CXIII. GESNERIÆÆ.

Genera 6, Species 38; Hot-house Species 38; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ↑ 0 feet; ↓ 0 feet; ± 0 feet.

Fine tropical herbs, with broad, fleshy, downy leaves, and purple or scarlet flowers. They all require stove heat, and decayed vegetable soil; in their native country, which is chiefly equinoctial America, they are found growing in the woods, where the earth is little more than a bed of rotten leaves and bark. Cuttings.

1698 *Genèdria* L.  
1699 *Codonòphora* Lindl.

1700 *Pentaràphla* Lindl.  
1701 *Sinningia* Nees

1809 *Beslèria* L.  
1702 *Gloxinia* Herit.

335. ORDER CXIV. VACCINIEÆ.

*Genera* 2, *Species* 56; *Hot-house Species* 2; *Green-house Species* 1; *Hardy Ligneous Species* 53; *Hardy Herbaceous Species* 0. ♀ 28½ ft.; ♂ 0 feet; ± 0 feet.

Elegant shrubs, chiefly natives of North America, Europe, and Asia. The *Oxycoccus macrocarpus* furnishes the cranberries sent from North America, and the *Oxycoccus palustris* those of Europe. *Vaccinium Myrtillus* is the well known whortle-berry. The order is chiefly distinguished by its inferior berry. The utility of the fruit of *Vaccinium* is well known; its bark is reckoned tonic, stimulant, and astringent, and the fruit slightly styptic. Cuttings, layers, and seeds.

1194 *Vaccinium* L. \*49 0 | 1193 *Oxycoccus* Pers. \*4 0

336. ORDER CXV. ERICEÆ.

*Genera* 28, *Species* 958; *Hot-house Species* 7; *Green-house Species* 683; *Hardy Ligneous Species* 255; *Hardy Herbaceous Species* 13. ♀ 78½ feet; ♂ 4 feet; ± 0 feet.

These are distinguished from the neighbouring orders by their polyspermous fruit, aristate anthers, and dry shrubby habit. Every genus is eminently beautiful, and worthy of the most assiduous cultivation. The first tribe is a native of hill-sides and open plains, chiefly of the extra-tropical regions of the earth. Some are famous for their beauty, some for their fragrance, and many for their foliage. The Heaths are the glory of the Cape, the *Arbutuses* of Europe, the *Andromedas* of America, and *Cithra* of the Canaries. The species are principally North American. *Monotropa* stand in their systematic station as they grow in their native woods, lowly herbs among thickets of bushes and trees. *Rhodoracæ*, once considered as a distinct order, are chiefly North American; their flowers are less tubular than those of true *Ericææ*; but their habit is not materially different; here the *Azæla*, the *Kalmia*, and the *Rhododendron*, the pride of European gardens, as they are of their native woods, find their station. The berries of *Arctostaphylos bva-ursi* are considered lithontriptic; its leaves have also been employed successfully in infusions in obstinate cases of gonorrhœa. Extract of *Chimaphila umbellata*, in the form of pills, in doses of five scruples a day, has been found successful in cases of dropsy. Some of the species are possessed of narcotic qualities; this is the case with *Ledum*, *Rhododendron chrysanthum*, and especially *Azæla pónica*, honey obtained from the juice of which is said by Xenophon to have caused the death of many soldiers in the famous retreat of the ten thousand. An infusion of *Rhododendron maximum* is used in America in cases of chronic rheumatism, and that of *Rhododendron ponticum* in Asia, against gout and rheumatism. Cuttings, layers, division, and sometimes by grafts.

341. ORDER CXVI. PENEACÆÆ.

*Genus* 1, *Species* 8; *Hot-house Species* 0; *Green-house Species* 8; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Beautiful shrubs, natives of the Cape of Good Hope, with the habit of *Pimelæa*, and with corymbs of elegant pink flowers. Chiefly distinguished from *Epacridææ* in the calyx being of two leaves, and in the stigma being 4-cornered, as well as in the fruit being 4-valved with two seeds in each cell. Cuttings.

373 *Penæ'a* L.

SUBCLASS III. COROLLIFLO'RÆ. *Petals cohering in the form a hypogynous corolla, which is not attached to the calyx.*

*Genera* 485, *Species* 4190; *Hot-house Species* 1256; *Green-house Species* 902; *Hardy Ligneous Species* 233; *Hardy Herbaceous Species* 1799. ♀ 147½ ft.; ♂ 96½ feet; ± 8 feet.

To this subclass are to be referred all genera which have a monopetalous corolla, with the stamens inserted into it, and a superior ovarium.

342. ORDER CXVII. EPACRIDÆÆ.

*Genera* 18, *Species* 71; *Hot-house Species* 0; *Green-house Species* 71; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Elegant shrubs, all natives of New Holland, of a dry prickly habit, with tubular white or red flowers. They are chiefly distinguished from *Ericææ* in the anthers being awless. Cuttings.

345. ORDER CXVIII. SYMPLICUSÆÆ.

*Genus* 1, *Species* 4; *Hot-house Species* 1; *Green-house Species* 3; *Hardy Ligneous Species* 0; *Hardy Herbaceous Species* 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Shrubs with serrated leaves, turning yellow in drying, and small white flowers, which are sometimes fragrant. The leaves of most of them are astringent; those of *Symplocos tinctoria* are used in America under the name of Sweet-leaf, for dyeing yellow. Cuttings.

2186 *Symplocos* L.

## 346. ORDER CXIX. STYRACI'NEÆ.

*Genera 2, Species 7; Hot-house Species 0; Green-house Species 0; Hardy Ligneous Species 7; Hardy Herbaceous Species 0.* ♀ 23 feet; ♂ 0 feet; ± 0 feet.

Elegant trees with white flowers, chiefly natives of North America. The *Styrax officinalis* affords the official storax of Asiatic Turkey, which issues from incisions made in the bark. The *Halesia tetrapteris* is the well-known snowdrop tree, with its pendulous white flowers. Cuttings, layers, or seeds.

1352 *Styrax L.* 4 0 | 1432 *Halesia L.* 3 0

## 347. ORDER CXX. MYRSI'NEÆ.

*Genera 8, Species 52; Hot-house Species 31; Green-house Species 21; Hardy Ligneous Species 0; Hardy Herbaceous Species 0.* ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Showy shrubs, with evergreen undivided leaves, and cymes of white or red flowers. The *Ardisias* are common in collections. None are natives of Europe, but are found in the hot parts of Asia, Africa, and America. Nothing is known of their properties. Cuttings and seeds.

## 348. ORDER CXXI. SAPOTEÆ.

*Genera 11, Species 44; Hot-house Species 31; Green-house Species 6; Hardy Ligneous Species 7; Hardy Herbaceous Species 0.* ♀ 25 feet; ♂ 0 feet; ± 0 feet.

These are also shrubs and trees, which are mostly evergreen, and natives of the warmer regions of the world. Some of the *Bumëlias* are found in the southern states of N. America, but none of the order exists in Europe. They are chiefly valuable for their fruit, which, in many cases, contributes richly to the dessert. *Mimùsops Eléngi*, *Imbricaria malabárica*, and *Argánia Sideróxylon* are all of this description; the star apples of the West Indies, the produce of several species of *Chrysophyllum*, and particularly of *C. Caimito*, are esteemed delicious; and the *Medlars*, *Lucumas*, and *Sapotillas* of equinoctial America, all the fruit of different kinds of *A'chras*, are among the most valuable productions of the western world. The seeds of all the order are oily; those of *A'chras Sapota* are accounted diuretic and aperient. Their oil is not fluid, but so concrete as to have the appearance and consistence of butter, whence the name of butter-tree has been applied to different species both in Africa and India. The most famous of this description is the Indian mava, mahva, or madhuca, the *Bassia butyrácea* of botanists; the seeds of which are so oleaginous, that a single tree has been known to produce three quintals of oil; the dried flowers of the same tree are mixed by some Indians with their food, and a kind of spirit is distilled from them by others. The juice of all the *sapotas* is milky, but not acrid and poisonous like that of most other lactescent orders, but, on the contrary, yielding a wholesome beverage or food. According to Brown, the bark of some of the *Achras* and *Lucumas* is so astringent and febrifugal as to be substituted for quinquina. Cuttings and seeds.

|                              |     |                                      |     |                         |

## 349. ORDER CXXII. EBENA'CEÆ.

*Genera 4, Species 38; Hot-house Species 12; Green-house Species 22; Hardy Ligneous Species 4; Hardy Herbaceous Species 0.* ♀ 6 feet; ♂ 20 feet; ± 0 feet.

Some of these are hardy trees or shrubs, with deciduous leaves and white flowers, natives of woods, mountains, and banks of streams in North America, Europe, and New Holland; others are tropical evergreens. Of the latter, many of the *Diospyros* produce eatable fruit; as, for example, the *Mabolo* of the Philippine Islands, which is as big as a peach, and the *Kaki* of Japan, which resembles an apricot. All these fruits are remarkable for their extreme austerity before maturity, and the necessity of letting them decay, like our medlars, before they are fit for table. These are also distinguished for the excessive hardness of their wood, and for the black color it sometimes acquires when old, as the *Ebony*. The bark of *Diospyros virginiana* is used in North America in intermittent fevers. Cuttings and layers.

## 350. ORDER CXXIII. BREXIE'Æ.

*Genus 1, Species 3; Hot-house Species 3; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0.* ♀ 0 feet; ♂ 0 feet; ± 0 feet.

A very obscure order, its place in the Natural System is extremely doubtful. Fine trees with the habit of *Theophrásta*, and with axillary bunches of white flowers. Cuttings.

523 *Bréxia Nor.*

## 351. ORDER CXXIV. OLE'IN'Æ.

*Genera 11, Species 124; Hot-house Species 11; Green-house Species 23; Hardy Ligneous Species 90; Hardy Herbaceous Species 0.* ♀ 137½ ft.; ♂ 0 feet; ± 0 feet.

The olives are known by their monopetalous corolla, with a valvular aestivation, two stamens alternate with the segments, a bilocular ovary with no discus at the base, and pendulous collateral ovula. They were formerly combined with the jasmynes. They have all simple opposite leaves; their flowers either white yellow, or purple, and frequently fragrant. The *Phillyreas* are among our finest evergreens, and the *Lilac* or *Syringa* perhaps at the head of hardy deciduous bushes. The ash is an anomalous genus which hardly belongs to the order. The seed of the olive contains so large a proportion of fixed oil, that it has long been one of the most important objects of cultivation in the south of Europe. The bark and leaves of many *Oleinae* are bitter and astringent; these properties are particularly apparent in the ash, which has often been employed successfully as a febrifuge. From the exudation of many species of that genus, the mild purgative called *manna* is formed; it is most commonly found upon the *O'rnus europæa*. M. Decandolle remarks, that in proof of the natural affinity of the plants here combined, and of the propriety of separating the jasmynes from them, it has been found that all the olives, as now restricted, will bud or graft upon one another, but not on the jasmynes. Thus the *lilac* will graft on the ash, the *Chionánthus*, and the *Fontàndesia* and even upon *Phillyrea latifolia*; and the olive will take upon the *Phillyrea*, and even on the ash. Cuttings, layers, and by grafts or buds.

352. ORDER CXXV. JASMINÆÆ.

Genera 2, Species 40; Hot-house Species 22; Green-house Species 12; Hardy Ligneous Species 6; Hardy Herbaceous Species 0. ♀ 6 feet; ♂ 0 feet; ± 0 feet.

Fragrance is the predominant property of the jasmine, and has made it for ages the favourite of poets and of the people; this arises from the presence of an oil which can be extracted so as to retain its perfume. In medicinal qualities, the jasmīnes do not differ materially from the last; they are neatly distinguished by botanists by the direction of their ovula, which are erect in Jasmīnææ, and pendulous in O'leina. Cuttings.

|------------------|--|----------------|---|---|

353. ORDER CXXVI. STRYCHNÆÆ.

Genera 3, Species 10; Hot-house Species 9; Green-house Species 1; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

Tropical trees, nearly allied to Apocynææ, and like them truly poisonous. The Strychnos nux vómica is remarkable for its bitterness and acrid deleterious effects, which are indicated not only when introduced into the stomach, but still more violently when introduced into the system by inoculation. Theophrastus are fine stove trees, with simple stems, and undulated spiny-toothed leaves, which are disposed in something like whorls. Cuttings and seeds.

354. ORDER CXXVII. APOCYNÆÆ.

Genera 36, Species 145; Hot-house Species 115; Green-house Species 14; Hardy Ligneous Species 9; Hardy Herbaceous Species 7. ♀ 7 feet; ♂ 8 feet; ± 0 feet.

We now turn from the contemplation of plants endowed with mild and agreeable properties, and fragrant flowers, and often bearing food for man, to others which are among the most dangerous and fatal poisons; whose juices though milky are not a wholesome and delicious beverage like those of Sapótææ, but, on the contrary, acrid, caustic, or bitter. They are readily known by the twisted direction of the segments of the corolla, which have been compared to the rays of a Catherine's wheel, whence they were called by Linnæus, Contortæ. By far the greatest part of the order consists of tropical trees and shrubs; a few Apocynums, Amsonias, and Vincas, are natives of the colder zones of the earth. Many are elegant climbers, as the different species of Echites and Melodinus. The splendid Oleander belongs to Nerium; the different species of Plumíeria, Camerária, Strophánthus, and Arduina are stove plants of the greatest beauty. The medicinal action of these plants is highly powerful. In general, the Apocynææ are acrid, stimulating, and astringent; these principles, when in excess, act so powerfully on the nerves as to produce stupefaction. The root of Ophióxyton is very bitter and purgative: under the name of snake-root it is used in India as an antidote to the bites of serpents. The bark of Cérbera Mánghas is purgative; of Echites antidysentérica, and the Wrightia of the same name, astringent and febrifugal; the leaves of the Vincas are so astringent, that they have been used successfully in tanning; those of Nerium Oleánder are said to abound in free gallic acid. The inspissated juice of a species of Cérbera, known in Mexico under the name of Ycotli, is a fatal poison. Cuttings or divisions.

355. ORDER CXXVIII. ASCLEPIA'DEÆ.

Genera 44, Species 264; Hot-house Species 187; Green-house Species 32; Hardy Ligneous Species 2; Hardy Herbaceous Species 43. ♀ 3 feet; ♂ 18 feet; ± 0 feet.

These differ from the last only in having the stamens united into a sort of fleshy crown, and the pollen coherent in masses of a waxy substance like that of Orchideæ; their properties, habit, and geographical range, are much the same. Periploca is a singular instance of an asclepiadeous plant being a hardy shrub, every other frutescent species of the order being natives of countries where frost is unknown. Huya comprehends climbing plants, with waxen, clustered, odoriferous flowers distilling honey. Pergulária is valued for its fragrance, Ceropégia for its singularity, and Asclépias for beauty and hardness. But the most extraordinary genera of the order are Stapélia, Piaránthus, and Huérnia, in which the place of leaves is supplied by fleshy short stems of various forms, and whose flowers are not less singular for their curious and complex organisation, than they are remarkable for their strange colouring and spotting, and offensive for their odor. The root of Diplólepis vomitorium, Asclépias curassávia, Calótropis procera, and some others, is employed in different countries for ipecacuanha. An infusion of the root of Asclépias decumbens has the singular property of exciting general perspiration; whence it is successfully used in Virginia for pleurisy. It is very singular that, in a tribe of plants so generally poisonous as these are, the young shoots of some species should be an article of food: of this nature are Pergulária edulis, Oxystélma esculénta, Hemidesmus indicus, and several more. Cuttings or divisions.

## 356. ORDER CXXIX. GENTIANACEÆ.

Genera 22, Species 144; Hot-house Species 19; Green-house Species 32; Hardy Lignous Species 0; Hardy Herbaceous Species 93. ♀ 0 feet; ♂ 16 feet; ≅ 4 feet.

An order in some degree intermediate between Polemoniaceæ and Scrophularinæ, from both which it is distinguished both by habit and fruit; some of the genera border closely upon Apocynæ. The species are natives of cool or mountainous regions or pools in all parts of the world. The Gentians are mostly dwarf herbaceous plants, with deep blue flowers; the latter color, and different shades of orange, being the prevailing hues. They are all pretty, and many beautiful in the highest degree; but, with a few exceptions, they are impatient of cultivation. The medicinal properties of the root of *Gentiana lutea*, *rubra*, and *purpurea*, are eminently tonic, stomachic, and febrifugal; their bitterness is second only to Quassia. Similar, but more feeble virtues, are found in most of the order, especially in *Villarsia ovata*, *Erythraea chilensis*, *Chiragita*, *Fraseria* Walpers, &c. *Spigelia anthelmia* is used as a vermifuge; and the root of *Spigelia marylandica* infused in water as anthelmintic, and in wine as febrifuge. *Potilla amara* is used in Guiana as an emetic. A kind of spirit is distilled in Switzerland from the roots of *Gentiana macerata* in water. Cuttings, division, or seeds.

## 357. ORDER CXXX. BIGNONIAÆ.

Genera 11, Species 92; Hot-house Species 78; Green-house Species 9; Hardy Lignous Species 5; Hardy Herbaceous Species 0. ♀ 11 feet; ♂ 0 feet; ≅ 0 feet.

The showy trumpet-shaped flowers and broad pinnated leaves of these plants render them objects of general admiration. The greatest number is found in the equinoctial regions, a few only passing beyond those limits to the north. *Tecoma radicans* is a hardy climbing plant, of exceeding beauty; and the *Jacaranias* are resplendent with flowers of blue or purple, and leaves which emulate the elegance of the *Azalea*. Nothing important is known of their qualities. Their wood is said to resist the attack of worms. Cuttings or layers, sometimes by seeds.

## 358. ORDER CXXXI. COBÆACEÆ.

Genus 1, Species 1; Hot-house Species 0; Green-house Species 1; Hardy Lignous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ≅ 0 feet.

A climbing genus with large purple flowers and pinnated tendrilled leaves, recently separated from the *Bignonias* by Mr. Don. Nothing is known of its medicinal properties. Seeds.

468 *Cobæa* Cav.

## 359. ORDER CXXXII. PEDALIACEÆ.

Genus 1, Species 1; Hot-house Species 1; Green-house Species 1; Hardy Lignous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ≅ 0 feet.

Herbaceous plants, formerly included in *Bignoniaceæ*, from which they are distinguished by the small number of seeds in each cell of the fruit. Seeds and cuttings.

1760 *Pedilium* L.

## 360. ORDER CXXXIII. SESAMEÆ.

Genera 4, Species 5; Hot-house Species 4; Green-house Species 3; Hardy Lignous Species 0; Hardy Herbaceous Species 1. ♀ 0 feet; ♂ 3 feet; ≅ 0 feet.

Annual plants, natives of the tropics, with showy trumpet-shaped flowers and simple leaves. The seeds of *Sesamum* abound in oil, which is easily expressed, for which the common species is extensively cultivated in hot countries. Seeds.

|                                |   |   |                            |

## 361. ORDER CXXXIV. POLEMONIACEÆ.

Genera 9, Species 61; Hot-house Species 1; Green-house Species 3; Hardy Lignous Species 0; Hardy Herbaceous Species 55. ♀ 0 feet; ♂ 17 feet; ≅ 0 feet.

Herbaceous plants with showy blue, red, or white flowers, and often with pinnated leaves. They are natives of cool or mountainous parts in Europe and America. Nothing is known of their properties. Division, cuttings, and seeds.

|                          |     |    |                          |     |                            |     |

## 362. ORDER CXXXV. HYDROLEACEÆ.

Genus 1, Species 2; Hot-house Species 0; Green-house Species 2; Hardy Lignous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ≅ 0 feet.

Elegant little plants with blue flowers, chiefly distinguished from *Convolvulaceæ* and *Polemoniaceæ* in the flowers having two styles, as well as in the two-valved capsules. The roots of *Hydrillea spinosa* are reputed bitter and slightly purgative. Cuttings and seeds.

795 *Hydrillea* L.

## 363. ORDER CXXXVI. CONVULVULACEÆ.

Genera 13, Species 225; Hot-house Species 20; Green-house Species 36; Hardy Lignous Species 1; Hardy Herbaceous Species 38. ♀ 3 feet; ♂ 10 feet; ≅ 0 feet.

Nearly the whole of these are twining plants with showy flowers expanding beneath the influence of bright sunshine. A few are shrubs, but the greater part are herbaceous, and very many annual. They are dis-

quently, also, weeds, which, from their creeping roots, are difficult to extirpate. All parts of the world produce them, from the cold regions of the north to the burning soil of the equator. *Cuscuta* is a singular parasite, wholly destitute of leaves. The root of many is filled with a milky acrid juice, which is very purgative. Scammony, jalap, and some other drugs, are the produce of Convolvaceæ. The roots of *Ipomœa florida*, *scoparia*, and *Quamoclit*, are stimulatory; that of *Ipomœa Batatas*, which is the sweet potato of America and Southern Europe, and that of *Ipomœa edulis* are wholesome articles of food. Their botanical characters are very nearly the same as those of Polemoniaceæ. Cuttings, divisions, or seeds.

364. ORDER CXXXVII. BORAGINÆÆ.

Genera 26, Species 279; Hot-house Species 21; Green-house Species 63; Hardy Ligneous Species 2, Hardy Herbaceous Species 193. † 5 feet; ‡ 31 feet; ≧ 4½ feet.

True Boraginæ are chiefly herbaceous plants, with alternate extipulate leaves, the surface of which is covered over with minute asperities, and with flowers arranged in one-soed spikes or racemes, occasionally solitary. Each flower has also four distinct little nuts or seeds, as they are commonly called. Some *Echium* and a few more are shrubs. They are found abundantly in Europe, Siberia, and the north of Africa, less commonly in India, and the equinoctial parts of the world; in some quantity in North America, and in tolerable abundance in New Holland. Within the tropics the order is principally represented by *Heliotropium* and *Tournefortia*; in colder latitudes by *Anchusa*, *Cynoglossum*, herbaceous *Echium*, and the like. Some are mere weeds, quite unworthy of culture; others are eminently beautiful, as many *Echium*, *Onosmas*, *Onosmodium*, *Symphytum*, and others. In general they are mucilaginous and emollient, qualities which are especially abundant in the root of *Symphytum* and *Cynoglossum*. Pure nitre has been found in several plants of the order. A red colour is given out by *Anchusa tinctoria*, *Lithospermum tinctorium*, and *Onosma echinoides*, which is used in dyeing. Several plants are employed on the same account in America. The *Hydrophyllæ* are often considered as distinct, on account of their capsular fruit and cartilaginous albumen. One or two of these are pretty plants, but most of them mere weeds. Cuttings, division, and seeds.

365. ORDER CXXXVIII. CORDIAÆÆ.

Genera 5, Species 46; Hot-house Species 45; Green-house Species 1; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. † 0 feet; ‡ 0 feet; ≧ 0 feet.

Trees formerly referred to the last order, from which their habit, plicated cotyledons, and dichotomous style divide them. Little is known of their properties, except that the flesh of their fruit is emollient and mucilaginous. The nuts of *Cordia Sebestena* are employed sometimes as laxatives. Cuttings.

367. ORDER CXL. SOLANÆÆ.

Genera 33, Species 461; Hot-house Species 143; Green-house Species 96; Hardy Ligneous Species 18; Hardy Herbaceous Species 204. † 14 feet; ‡ 44 feet; ≧ 0 feet.

The baneful nightshade represents this order, which participates very generally in its qualities, although they are frequently hidden beneath a fairer form, and often much mitigated. Many of the Solanums are very handsome. The *Verbascums*, *Daturas*, and *Solanidas* are all plants of great beauty, although the former, on account of their frequency, are despised in gardens. Capsicums are famous for their pungent fruit and seeds; *Brunfelsias* for their fragrance, and *Nicotianas*, or Tobacco, for their factor. The leaves, indeed, of the whole order are disagreeably scented. The usual effect of Solanææ is narcotic; but it is thought that this has been exaggerated, on account of the intense and deleterious properties of *A'tropa Belladonna*. These, according to the observations of Vauquelin, depend upon the presence of a bitter nauseous matter which is soluble in spirits of wine, forming with tannin an insoluble compound, and giving out ammonia when decomposed by fire. Notwithstanding the narcotic power of the roots of the Mandrake, the *Belladonna*, and others, those of the Potato are found to contain an abundant fructa, which is among the most valuable food of man. The leaves of many Solanææ are exciting and narcotic, but in very unequal degree, as in Tobacco, *Physalis*, Henbane, &c.; those of the Nightshade excite vertigo, convulsions, and vomiting. The juice of *Stramonium* is given in North America, in doses of from twenty to thirty grains, in cases of epilepsy. The fruit of *Physalis Alkekengi* is a veterinary diuretic; that of *P. edulis* is used in tarts; that of *Solanum Lycopersæum*, and *Melongena*, is served at table in various forms, under the name of Tomatoes and Aubergines. Cuttings, division, and seeds.

## 370. ORDER CXLI. SCROPHULARINÆ.

*Genera 59, Species 545; Hot-house Species 40; Green-house Species 118; Hardy Ligneous Species 3, Hardy Herbaceous Species 384. ♀ 10½ ft.; ♂ 4½ feet; ± 6 feet.*

A great part of Linnaeus's *Didynámia Angiospérma* is found here, capsular fruit and didynamous stamens being among the most obvious characteristics of the order. The species are generally herbs with opposite leaves, very rarely shrubs; and natives of mountains, valleys, ditches, woods, and waysides, in all parts of the world. The *Personatæ* have the palate so prominent as to close up the orifice of the corolla. Ringéntes have the palate open. Some are highly ornamental, as *Digitális*, *Pedicularis*, *Calceolaria*, &c., others are mere weeds, as is the case with a large proportion of them. Most of them have a weak unpleasant smell, a bitterish taste, and acrid and suspicious properties; but this odour is sweet and aromatic in the *Ambulia* of Lamarck, the taste is refreshing in *Mimulus luteus*, which is a culinary plant in Peru, and the ordinary acrid properties become emollient in some *Antirrhinums*. The *Rhinanthæceæ* are remarkable for their astringent tonic bark and leaves. The leaves and roots of *Scrophularia aquatica*, *Gratiola officinális* and *peruviana*, and *Calceolaria* act as purgatives, or in strong doses produce vomiting: these properties exist, in a high degree, in *Digitális purpurea*. The leaves of this plant, reduced to powder, excite vomiting and vertigo, excite urine and saliva, and lower the pulse: in too strong doses they cause death; in moderate doses they are useful in scrophula, dropsy, asthma, &c. Cuttings, divisions, and seeds.

## 373. ORDER CXLIII. LABIATÆ.

*Genera 78, Species 858; Hot-house Species 69; Green-house Species 189; Hardy Ligneous Species 76; Hardy Herbaceous Species 524. ♀ 23½ feet; ♂ 52½ feet; ± 1 foot.*

A portion of *Diándria Monogýnia*, and the whole of *Didynámia Gymnospérma*, of Linnaeus, make up *Labiátæ*, which are characterised by their didynamous stamens, four little nuts or naked seeds, single style, and irregular corolla. They are mostly natives of extra-tropical countries, although under the form of *Hýptis*, *Anisómeles*, *Leucas*, *O'cymum*, &c., they are found in the hottest zones of the world. Many are extremely odoriferous in the leaves, some bear handsome flowers, but by far the greater part are no better than weeds. They are all remarkable for their tonic, cordial, and stomachic virtues: they contain both a bitter and an aromatic principle, in different proportions. The bitterness which is given out in decoctions, resides in a gum-resinous secretion, abounding in some *Teucriums*, which are particularly employed as stomachics, and sometimes as febrifuges: those which abound in essential oil, and which are consequently aromatic, are used as stimulants. From the different degree of combination of these principles in different plants, they have obtained various uses; such as savory, thyme, marjoram, for the seasoning of food; sage, balm, ground ivy for tea; marum, majoram, lavender, and thyme for sternutatories; others, such as lavender, mint, balm, and rosemary, for perfumes. It is a remarkable fact, that the essential oil of all contains camphor, which exists in such quantity in sage and lavender, that it has been supposed that the separating of it might become an object of commerce. Cuttings, divisions, and seeds.

381. ORDER CXLIII. VERBENA'CEÆ.

Genera 29, Species 217; Hot-house Species 141; Green-house Species 47; Hardy Ligneous Species 3; Hardy Herbaceous Species 26. † 14½ ft.; ‡ 12½ ft.; ± 0 feet.

A mixture of weeds and showy herbs, of humble creeping plants and of lofty timber trees. Some of the Vitexes and Clerodendrams are handsome shrubs: Aloysia is esteemed for the fragrance of its flowers, and Holmskiöldia for the refulgent scarlet of its enlarged calyxes. Tectona produces the famous Indian teakwood. No properties of consequence have been attributed, by medical men, to any plant of the order, those formerly ascribed to the vervain and chaste-tree being now disregarded. The species are natives of waysides in Europe, and of woods and barren plains in the tropics. Cuttings, divisions, and seeds.

382. ORDER CXLIV. MYOPO'RINÆ.

Genera 4, Species 18; Hot-house Species 2; Green-house Species 16; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. † 0 feet; ‡ 0 feet; ± 0 feet.

South Sea and New Holland shrubs, with scarcely any hair. The leaves are simple, alternate, or opposite, with no stipulæ. The flowers, scarlet, white, or blue, axillary without bractææ. These are very near Verbenææ. Stenochilus is the handsomest genus of the order: the Avicennias are shore plants, growing in the place of the mangroves, and shooting their long roots to a great distance among the mud, sometimes to the length of six feet along the surface before they fix themselves. Their medicinal properties, if any, are unknown. Cuttings.

383. ORDER CXLV. ACANTHA'CEÆ.

Genera 18, Species 168; Hot-house Species 144; Green-house Species 18; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. † 0 feet; ‡ 7 feet; ± 0 feet.

These are known by the elastic dehiscence of their capsules, and the hooked processes of the seeds. They are almost entirely tropical herbs or shrubs, with the pubescence, if any, simple or capitate, but never stellate. Their leaves are opposite, occasionally arranged in fours, simple and undivided, or very seldom lobed. The flowers are either in imbricated heads or open racemes, always enclosed in their bractææ; and are white, blue yellow, scarlet, or purple. Some of the species are very showy, but few of them are cultivated commonly; a large proportion are mere weeds. The Thunbergias are fine climbers, and the Acanthus mollis, the foliage of which gave rise to the classical acanthus of architecture, is, perhaps, except Morina pérsica, one of the most interesting of hardy herbaceous plants. It is also one of the few species to which any medicinal properties are ascribed, being used sometimes as an emollient by reason of its mucilage. Justicia biflora is employed in Egypt as a poultice, J. Ecballium as a diuretic, and J. pectoralis as a vulnerary. Cuttings, seeds, and division.

385. ORDER CXLVII. LENTIBULA'RIÆ.

Genera 2, Species 9; Hot-house Species 0; Green-house Species 2; Hardy Ligneous Species 0; Hardy Herbaceous Species 7. † 0 feet; ‡ 2 feet; ± 2 feet.

Very pretty interesting aquatics, which are scarcely susceptible of cultivation, except in a few cases. The Pinguiculas are either European or North American, inhabiting elevated patches in bogs: the Utricularias are floaters, found in most countries in marshes and little rills: their flowers, are white, yellow or blue. Offsets

386. ORDER CXLVIII. PRIMULA'CEÆ.

Genera 17, Species 143; Hot-house Species 0; Green-house Species 14½; Hardy Ligneous Species 0; Hardy Herbaceous Species 115. † 0 feet; ‡ 11 feet; ± 3 feet.

Beautiful dwarf herbs, inhabiting the mountains and meadows of all parts of the world, but especially in the northern hemisphere. Nothing can be more lovely than the little delicate alpine Primulas, Androsaces, Aretias, and Soldanelias, with their little modest blossoms, sometimes rivaling the whiteness of the surrounding snow, sometimes emulating the intense blue of the empyrean, as if the one had borrowed its hues from heaven, and the other from the spotless mantle of the earth. Hottónia is a naiad of the stream, inhabiting several parts of England, in ponds and ditches, which are enlivened for many a month with its rosy flowers, peeping from among the sedge and under-grass by which it is environed. All the genera are familiar to gardeners, except Centunculus and Schwénckia, of which the former is singular in the order, as being

an obscure minute weed, and the latter has inelegant green flowers, curious to the botanist but ungrateful to the florist. The prominent botanical character is the one-celled fruit, with a central placenta, and the stamens opposite the petals. The properties of Primulacæ are feeble and of little consequence; they appear to be slightly astringent and bitter; the root of *Cyclamen* is acrid, and only eaten by wild boars; the flowers of the primrose and cowslip are fragrant, and mildly sudorific and soporific. *Cortusa Mathiola* has been used in nervous disorders. Division, offsets, and seeds.

|                            |    |    |                           |    |    |                             |    |   |

## 387. ORDER CXLIX. GLOBULARIÆ.

*Genus 1, Species 10; Hot-house Species 0; Green-house Species 4; Hardy Ligneous Species 0; Hardy Herbaceous Species 6.* † 0 feet; ‡ 2½ feet; § 0 feet.

Pretty alpine plants with blue flowers. The leaves of *Globularia Alypum* are very bitter and powerfully purgative, giving at the same time a tone to the stomach and intestines. Divisions and cuttings.

|                          |   |   |
|--------------------------|---|---|
| 342 <i>Globularia L.</i> | 0 | 6 |
|--------------------------|---|---|

## 388. ORDER CL. PLUMBAGINEÆ.

*Genera 3, Species 82; Hot-house Species 6; Green-house Species 27; Hardy Ligneous Species 0; Hardy Herbaceous Species 49.* † 0 feet; ‡ 12 feet; § 0 feet.

These are properly placed at the limit between *Monochlamydeæ* and *Dichlamydeæ*, to either of which they are referable in the minds of some botanists, although it appears, upon the whole, to be most convenient to station them where they are now arranged. They are low shrubs or herbaceous plants, with showy red or blue flowers of an arid texture, inhabiting salt marshes and subalpine tracts, in the temperate latitudes of both the northern and southern hemispheres. All the *Statice* and *Armeria* are fine plants worth cultivating. The root of *Statice Limonium* is astringent and tonic; of the *Plumbago*, the root and whole plant are acrid and caustic, and employed as vesicatories. Divisions, cuttings, and seeds.

|                       |    |    |                       |    |    |                        |   |   |

| 929 <i>Statice L.</i> | *0 | 28 | 928 <i>Armeria L.</i> | *0 | 18 | 423 <i>Plumbago L.</i> | 0 | 3 |
|-----------------------|----|----|-----------------------|----|----|------------------------|---|---|

SUBCLASS IV. MONOCHLAMYDEÆ. *Perianthium simple.*

*Genera 256, Species 2628; Hot-house Species 669; Green-house Species 727; Hardy Ligneous Species 609; Hardy Herbaceous Species 623.* † 334½ ft.; ‡ 55½ ft.; § 6½ feet.

The absence of corolla characterises this subdivision of dicotyledonous vegetation; but, as the term corolla is subject to frequent misunderstanding, it should be borne in mind, that whenever there is only one floral envelope, that envelope is to be considered calyx, whether green, as in most cases, or colored, as in the *Marvel* of Peru.

## 389. ORDER CLI. PLANTAGINEÆ.

*Genera 3, Species 80; Hot-house Species 0; Green-house Species 15; Hardy Ligneous Species 2; Hardy Herbaceous Species 76.* † 2½ feet; ‡ 13½ ft.; § 1 foot.

Little inconspicuous herbs found in waste places all over the world. The leaves are stellate, and occasionally ternate; the pubescence is jointed; the flowers are brownish, and arrayed in dense spikes. Their leaves are rather bitter and astringent; their seeds mucilaginous and rather acrid; those of *Plantago arenaria* are imported in large quantities from the south of France, for the purpose of forming an infusion in which muslins are washed. *P. media* is sometimes cultivated by farmers under the name of ribgrass. Divisions and seeds.

|                        |    |    |                           |    |   |                     |    |   |

|------------------------|----|----|---------------------------|----|---|---------------------|----|---|

## 390. ORDER CLII. NYCTAGINEÆ.

*Genera 7, Species 47; Hot-house Species 21; Green-house Species 15; Hardy Ligneous Species 0; Hardy Herbaceous Species 11.* † 0 feet; ‡ 6½ feet; § 0 feet.

With the exception of *Mirabilis*, in which the colored calyx has a showy effect, all the order consists of weeds, growing often among the loose sand on the sea coast of the tropics and western hemisphere; none are found in Europe. The *Abronia*s are curious, neat, and often fragrant. The root of *Mirabilis Jalapa* was formerly considered the jalap, which is now known to be an error; it is however purgative, although in a less degree. *Boerhaavia tuberosa* is also a reputed purgative. Cuttings, divisions, and seeds.

|                                 |   |   |                         |   |   |                        |

## 391. ORDER CLIII. AMARANTHACEÆ.

*Genera 16, Species 140; Hot-house Species 46; Green-house Species 30; Hardy Ligneous Species 0; Hardy Herbaceous Species 64.* † 0 feet; ‡ 21½ feet; § 0 feet.

Upon this order Dr. von Martius has the following remarks:—Leaves, especially when young, of a lax soft texture, abounding in saccharine, mucilaginous, and fibrous particles, and therefore fit for food. The seeds are farinaceous, consisting chiefly of starch and mucus. Their virtues are nutritive, emollient, demulcent; the root of *Gomphrena officinalis* is tonic and stimulant. The species are either gregarious or solitary; mostly diffuse and villous, and existing in dry stony exposed places, or erect and reclining on other vegetables, with little pubescence, when found on the skirts of ancient forests; a few are found in saline coast places; finally, they are more common in low land, little elevated above the surface of the sea, than in mountainous regions. They are met with in both hemispheres; rarely under the equator, but increasing both northwards and southwards as we recede from them; they are confined to no countries in particular, but are found to affect all regions of the world. Among an abundance of weeds, we distinguish a few fine plants deserving cultivation, as the *Globe Amaranthus*, the *Cockscombs*, and a few species of *Amaranthus*, one of which, under the name of *Love-lies-bleeding*, is commonly reared for the sake of its long, tail-like, pendent masses of crimson flowers. *Amaranthus oleraceus*, and a few others, are occasionally cultivated as potherbs. Cuttings and seeds.

|                                  |    |    |                                 |   |   |                                 |

392. ORDER CLIV. PHYTOLACEÆ.

Genera 5, Species 21; Hot-house Species 20; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 1. ♀ 0 feet; ♂ 3 feet; ± 0 feet.

Insignificant herbaceous plants, rarely shrubs, with racemes of white, red, or greenish flowers. Petiveria when bruised smells like garlic. Phytolacca roots, leaves, and berries are violent purgatives and emetics; those of P. decandra, or Virginian Poke, are esteemed in North America nearly equal to Guaiacum, and are employed in chronic rheumatisms, and in rheumatic pains following syphilis. An extract of the berries has been employed in scrofula and cancerous ulcers, and the young shoots of the plant are eaten in the United States as asparagus.

393. ORDER CLV. CHENOPODEÆ.

Genera 22, Species 193; Hot-house Species 8; Green-house Species 27; Hardy Ligneous Species 6; Hardy Herbaceous Species 152. ♀ 7½ feet; ♂ 28½ feet; ± 0 feet.

The habit of this order is a better distinction from Amaranthaceæ, than any artificial character which it is easy to point out. While Amaranthaceæ have a dry perianthium with a dense inflorescence, Chenopodeæ, on the contrary, have a fleshy perianthium and a very effuse inflorescence. In the former, the stamens are usually inserted under the ovarium; in the latter into the calyx; but this mark is not constant. None of them, unless Phytolacca is excepted, can be esteemed plants of ornament; on the contrary, they have a weedy uninviting appearance, which is not improved by the fetid smell of some of them. But, although their appearance is less attractive than that of the Amarants, their use to man is far more considerable. Their qualities are very various; Camphorosma has the smell of camphor. Some of the Chenopodiums, as ambrosioides, Botrys, &c., possess antispasmodic and tonic properties; the leaves of Spinacia, and of many Chenopodiums, are eaten as spinach; as are those of Basella in China and India. Salsola and Salicornia are often employed as pickles. Beet roots are equally valuable as a culinary and agricultural production, and the leaves are an excellent vegetable when boiled. But the most remarkable feature in the properties of the order is the abundant production of soda, which is obtained from many of the species, as from all the Salsolas, Salicornias, Anabasis, many species of Atriplex, several salt-marsh Chenopodiums, and others. The seeds of Chenopodium anthelminticum are used as a vermifuge, those of Atriplex hortensis excite vomiting, frequently attended with acute pain; those of Chenopodium Quinoa are said to be used as rice. To conclude this list of remarkable properties in one of the most vile of all assemblages of plants, the roots of beet yield an abundance of sugar. Cuttings, divisions, and seeds.

394. ORDER CLVI. BEGONIAE.

Genus 1, Species 35; Hot-house Species 32; Green-house Species 3; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

The acid qualities, sheathing stipules, and alternate leaves of these tropical herbs approximate them to Polygoneæ, notwithstanding the very different structure of their fructification. Most of the species are pretty; some very handsome; all requiring great heat and humidity to be grown in perfection. Cuttings, divisions, and seeds.

2654 Begonia L.

395. ORDER CLVII. POLYGOÑEÆ.

Genera 14, Species 188; Hot-house Species 19; Green-house Species 22; Hardy Ligneous Species 6; Hardy Herbaceous Species 141. ♀ 6½ feet; ♂ 29 feet; ± 5½ feet.

Herbaceous or suffruticose fleshy-leaved plants, chiefly natives of the northern hemisphere; a few Polygonums and Coccolobas are found to the south, the former in barren places, the latter on sea shores. A great part of the order consists of worthless weeds. Some of the Polygonums, and all the Eriogonums, are handsome plants; the Rheums are famous in medicine. The root of Rheim is tonic and purgative; most of the Rumexes and Polygonums are also tonics. The juice of the Coccolobas is very astringent. The young leaves and shoots of several species of Rumex and Rheim are eaten either raw or baked, under the name of sorrel, French sorrel, and tart rhubarb. For the sake of its seeds, Polygonum Fagopyrum is cultivated by farmers under the name of buck-wheat; the seeds of P. aviculare are very emetic and purgative. The fleshy calyx of the Coccolobas is colored; and, the fruit growing in clusters, the genus has received the name of the sea-side grape. Cuttings, divisions, and seeds.

396. ORDER CLVIII. LAURINÆ.

Genera 7, Species 54; Hot-house Species 30; Green-house Species 15; Hardy Ligneous Species 9; Hardy Herbaceous Species 0. ♀ 3¾ ft.; ♂ 0 feet; ± 0 feet.

Noble trees or shrubs with handsome foliage and inconspicuous flowers. They are chiefly natives of hot countries, where they constitute some of the most valuable of the productions known under the name of spice. By botanists they are regularly recognised by the singular circumstance of their anthers having each four cells, the valves of which are hinged as it were to the upper edge of each cell, and do not open longitudinally like those of most other plants. It is well known that the cinnamon is the produce of the Cinnamomum verum, and that its properties are eminently aromatic, warm, and stomachic. The same peculiarities, but in a less degree, exist also in Cinnamomum Cassia, Malabátrum, and Cutiliban, which are all occasionally substituted for true cinnamon; they are found in the leaves of Laurus parvifolia, in the bark of the species which produces the Pichurim bean; in that of L. cupularis, which is the Isle of France cinnamon; of L. Quisnos, which yields the Peruvian cinnamon; in L. Benzoin, which was used as spice in the United States during the American war; and finally, in the common bay tree of our plantations. Laurus Sissafra yields the sassafras chips of the shops, but its bark is much more powerful. The fruit of many Laurinae is extremely aromatic; that of Persea gratissima is an agreeable West Indian fruit, called the alligator pear. Camphor is the produce of Cinnamomum Cimpfora, and of another or two; this substance is found indeed in small quantities in the roots of almost all the order; one of the cinnamoms is even named Capuru Carundu, which signifies camphorated cinnamon. Cuttings and layers.

## 397. ORDER CLIX. MYRISTICEÆ.

Genera 2, Species 6; Hot-house Species 6; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ≅ 0 feet.

Closely allied to the last, especially in sensible properties. The arillus of *Myristica* is the mace of the shops, and its nut the famous nutmeg. It is well known that this abounds with oil; in *Piròla sebifera* the oily secretion is so copious, that it is readily separated by immersion in boiling water, under the form of fat. Cuttings.

2829 *Myristica L.*| 2593 *Hernandia L.*

## 398. ORDER CLX. PROTEACEÆ.

Genera 32, Species 75; Hot-house Species 0; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ≅ 0 feet.

Favourite shrubs with gardeners, both on account of the neatness of their foliage and the beauty of their flowers. With very few exceptions, they are confined to the southern promontory of Africa, and to New Holland, where they adorn large tracts of country. They are shrubby or arborescent plants with an arid habit. The leaves are simple, evergreen, narrow, entire or serrated. The flowers generally grow in clusters, and are green, yellow, or red, sometimes in true Proteas surrounded by colored bractæ with dark hairy margins. Their stamens are four, with distinct anthers, which rarely adhere together. The pollen is triangular; the stigma undivided and usually oblique. Their fruit is of various kinds, either a solitary nut or a sort of cone consisting of many nuts immersed among the indurated remains of abortive flowers. Of their properties little is known. Some of the *Rhopala*s afford tolerable timber; the bark of *Protea speciosa* and *grandiflora* is astringent and useful in diarrhoeas. The seeds of *Embothrium tinctorium* yield a powder which is employed for dyeing pink. The Proteas of the Cape, and the *Banksias* and *Dryandras* of New Holland, are the finest plants of the order. Cuttings and seeds.

## 399. ORDER CLXI. THYMELÆÆ.

Genera 11, Species 99; Hot-house Species 5; Green-house Species 74; Hardy Ligneous Species 19; Hardy Herbaceous Species 1. ♀ 19 feet; ♂ 2 feet; ≅ 0 feet.

Nearly all shrubby plants, found in all parts of the world, but most abundantly in the south of Africa. The flowers are white, yellow, or red, most commonly in clusters, and often fragrant; the foliage is entire, either smooth or silvery, and generally very neat. Their wood is particularly soft; their inner bark easily separable, and, in *Daphne Lagétia*, pulls out by the division of the vertical fibres into a sort of network resembling lace. Their bark is extremely acrid, acting as a vesicatory when applied to the skin, and, if chewed, producing extreme heat and torture in the mouth; a decoction of it has been used with some success in venereal diseases. The seeds of these plants are poisonous to man, but birds eat them with impunity. The fibres of *Dicaea* and *Lagétia* are used for cordage; those of *Daphne Gnidium* and *Passerina tinctoria* are employed in the south of Europe for staining wool yellow, which is converted into green by the addition of *Isatis*. Cuttings and seeds.

## 400. ORDER CLXII. OSYRIDÆÆ.

Genera 2, Species 4; Hot-house Species 0; Green-house Species 4; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ≅ 0 feet.

Trees with flexile twiggy branches, and monocious or dioecious flowers. The leaves of *Osyris japonica* eatable as salad. Cuttings and seeds.

2747 *Osyris Lam.*| 2624 *Exocarpos Lab.*

## 401. ORDER CLXIII. SANTALACEÆ.

Genera 7, Species 21; Hot-house Species 2; Green-house Species 6; Hardy Ligneous Species 7; Hardy Herbaceous Species 6. ♀ 36 feet; ♂ 3 feet; ≅ 0 feet.

Trees or dwarf herbs, with inconspicuous or unattractive flowers. They are chiefly natives of the Cape, New Holland, and India, a few only being found in Europe and North America. Their virtues are few. The wood of *Santalum album* has a sweet aromatic flavor, and a slightly bitter taste; it is chiefly known as a perfume, although it is said to possess mild sudorific properties. The leaves of *Myoschilus* are purgative, of *Thesium* is slightly astringent. Cuttings, layers, divisions, and seeds.

## 402. ORDER CLXIV. ELÆAGNEÆ.

Genera 4, Species 13; Hot-house Species 3; Green-house Species 3; Hardy Ligneous Species 7; Hardy Herbaceous Species 0. ♀ 26½ ft.; ♂ 0 feet; ≅ 0 feet.

Hardy shrubs or small trees, with deciduous leaves, covered, as well as the bark, with minute silvery scales; their flowers are inconspicuous, but sometimes agreeably fragrant. They occupy but little space; a few inhabiting China and Japan, and the remainder Europe, North America, Guiana, and the East Indies. The berries of *Hippophae rhamnoides*, which are slightly acid, are used as a kind of sauce by the Swedes. Layers and cuttings.

|                             |    |   |                             |   |   |

401. ORDER CLXV. ASA'RINE.

Genera 2, Species 36; Hot-house Species 16; Green-house Species 5; Hardy Ligneous Species 3; Hardy Herbaceous Species 12.  $\uparrow$  3½ feet;  $\uparrow$  7 feet;  $\pm$  0 feet.

Here we are on the limits of Monocotylédones and Dicotylédones. The species are herbaceous or half-shrubby plants, with simple, often reniform, leaves; and mottled grotesque flowers, usually brownish purple. Their roots are all bitter, and possessed of tonic and stimulating properties; but the degree in which they exist in different species is not at present ascertained. The *Aristolochias* have been in former days praised as emmenagogues, and many are still used in South America as a remedy for the bite of serpents. *Asarum europæum* is a purgative and emetic when fresh, but its powers are much diminished by drying; its dried leaves are occasionally used by the country people in some parts of England as a sternutatory. Division and cuttings.

|                       |    |   |                             |    |   |

|-----------------------|----|---|-----------------------------|----|---|

402. ORDER CLXVI. CYTNEE.

Genus 1, Species 2; Hot-house Species 2; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0.  $\uparrow$  0 feet;  $\uparrow$  0 feet;  $\pm$  0 feet.

The famous pitcher-plants of China and the East Indies belong to *Nepenthes*, and bear leaves, the extremities of which are hollowed out into cup-like appendages that are generally filled with water, which seems as if confined within them by a little lid by which the pitchers are surmounted. Seeds.

2830 *Nepenthes* L.

403. ORDER CLXVII. EUPHORBIA'CEE.

Genera 47, Species 444; Hot-house Species 247; Green-house Species 66; Hardy Ligneous Species 12; Hardy Herbaceous Species 119.  $\uparrow$  25½ feet;  $\uparrow$  22½ feet;  $\pm$  0 feet.

Weeds and lofty trees, of such varied appearance and property, that it is scarcely possible to frame a brief character by which they can be expressed. Their vegetation in cold countries is mostly herbaceous, in hot countries frutescent or arborescent; their juice is milky, and their flowers mostly inconspicuous. It is for their medicinal properties that they are chiefly known, and these are as various as their aspect; mostly, however, dangerous, and always to be suspected. In a few of them the smell and taste are aromatic; but in most there is either no smell or it is nauseous, and the taste constantly acrid and pungent. Some possess also an acrid limpid fluid, which is given out by the leaves when touched. Many of them act strongly upon the kidneys, as several species of *Phyllanthus*, the leaves of *Mercurialis* annua, and the root of *Ricinus* communis. Many are said to be powerful medicines in cases of dropsy. The bark of several *Crotons*, the wood of *Croton Tiglium* and *Buxus*, the leaves of the same, and also of *Cicca disticha*, several *Euphorbias*, and others, are recorded as sudorifics, and useful against syphilis; as emetics, we find the roots of the *Euphorbias*, the juice of *Cómnia*, *A'nda*, *Mercurialis* perennis, &c. A great number are purgative, especially the leaves of *Buxus* and *Mercurialis*, the juice of *Euphórbia*, *Cómnia*, *H'ira*, the seeds of *Ricinus*, *Croton Tiglium*, *A'nda*, and *Játropha*. The effects of some others are so dangerous, particularly *Hippomane*, that it is not advisable to administer them even in very small doses; even in many *Euphorbias* it is difficult to draw a line between the quantity in which they are poisonous, and that in which they are harmless or useful. The nature of their poison is mostly acrid, occasionally, however, mixed with something narcotic, as is apparent from the effect of those which are used for poisoning or rather stupefying fish. The purgative oil in which the seeds of many are found to abound, has been determined to reside wholly in the albumen; hence the embryo of some, as *Omphálea diandra*, is eaten as nuts. Boiling or roasting has also the effect of dissipating their noxious effects; thus *Javipha Mámihot*, than which there scarcely exists a more dangerous poison, affords a food when submitted to fire, called cassava, the flour of which is often used in London as a luxury for making puddings, than which few are reputed to be more wholesome. But the most curious of all the products of *Euphorbiaceæ* is the *Cautouchou*, that singular substance which, although the produce of dangerous acrid trees, possesses nothing whatever which has been found capable of acting upon the human system in whatever way applied, which is unalterable either in air, in water, or in spirits, although it softens at a high temperature. It is chiefly produced by *Siphonia elástica*, but also exists in the juice of very many others, as *Excoecaria agallocha*, *Hippomane Manciniella*, *H'ira* crépitans, *Sápium aucuparium*, *Plukenétia volúbilis*, the *Jatrophas*, *Mábea*, *Omphaleas*, and many others. *Tourmesole*, another curious chemical preparation, is the juice of *Croton tinctorium*, but is also found in several others. Many other properties belong to this order, which it would be too long to detail in this place. The curious reader will find ample information in the medical division of *M. Adrian de Jussieu's* monograph of the order, from which most of the foregoing remarks are taken. Cuttings, division, and seeds.

410. ORDER CLXVIII. STACKHOUS'EE.

Genus 1, Species 1; Hot-house Species 0; Green-house Species 1; Hardy Ligneous Species 0; Hardy Herbaceous Species 0.  $\uparrow$  0 feet;  $\uparrow$  0 feet;  $\pm$  0 feet.

A small tribe of plants, natives of New Holland and Van Dieman's Land. Small shrubs with trifling flowers. Cuttings.

## 411. ORDER CLXIX. ANTIDÆSMÆ.

Genera 2, Species 7; Hot-house Species 7; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. † 0 feet; ‡ 0 feet; ≃ 0 feet.

Trees, natives of the East Indies, with simple leaves and inconspicuous diœcious flowers. Stilågo diåndra bears an acid catable fruit, as well as the species of Antidæsmæ; these hang in clusters like currants. A decoction of the leaves is reputed to be an antidote against the bite of serpents. Cuttings.

2766 Antidæsmæ L.

| 2746 Stilågo L.

## 412. CLXX. URTI^CEÆ.

Genera 24, Species 201; Hot-house Species 119; Green-house Species 27; Hardy Ligneous Species 17; Hardy Herbaceous Species 38. † 57 feet; ‡ 14 feet; ≃ 0 feet.

Few are the objects in this order deserving the care of the cultivator; it is rather extraordinary, however, that those few are abundantly so. Among worthless weeds and shabby half-herbaceous shrubs, some of which are covered with rough points, and others defended by stinging hairs, we find the fig, the mulberry, the hemp, the hop, and the bread-fruit, all objects of the first consequence to the world. Here, also, is placed the half-fabulous Upas, with which lying travellers and credulous naturalists have long deluded Europe. The Upas tree is now known to be the *Antiaris toxicaria*, the inspissated juice of which is, indeed, a frightful poison, but the baneful effects of whose branches are purely imaginary. Similar, though inferior, qualities have been found to exist in *Ficus toxicaria*, and some of the Artocarpus. The root of the black mulberry is bitter, acrid, and purgative; of *Dorstenia brasiliensis*, emetic; of *D. Contrayerva*, bitter, aromatic, hot, and stimulant. A decoction, or the dried leaves, of hemp, is eminently narcotic, and forms the basis of the well known intoxicating Turkish drug called Bang or Haschisch. The tenacious nature of the fibres of the hemp is also found in other plants of the order, especially *Urtica cannábina*, the hop, the bread-fruit tree, the common stinging-nettle, and others. Cuttings, layers, division, and seeds.

## 414. ORDER CLXXII. PIPERA^CEÆ.

Genera 3, Species 71; Hot-house Species 69; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 2. † 0 feet; ‡ 0 feet; ≃ 4 feet.

The peppers are far more valuable in commerce than interesting in cultivation, their flowers being in all cases very insignificant, and their leaves so uniform in appearance, as to create but little variety. Nearly the whole, indeed, of the herbaceous species, or *Peperomias*, as they are sometimes called, are mere weeds. The berry of the pepper is well known to be hot, aromatic, pungent, and stimulating; not only in the common peppers of the shops, but also in *P. Cubèba*, *Carpínga*, and *heterophyllum*. The *Piper anisatum* yields a strong smell of anise; a decoction of its berries is used in Spanish America for washing ulcers. The *Piper Bètel* and *Siribòæ* afford the Malays a powerfully acrid and exciting preparation, which, they suppose, invigorates and enables them to withstand the debilitating influence of their climate. In the South Sea islands, an inebriating beverage is procured by the mixture of the leaves and stems of *P. inebrians* with water. No pepper has yet been found beyond the limits of the tropics. *Saururus* is the representative of the order in extra-tropical countries. Cuttings, division, and seeds.

## 416. ORDER CLXXIV. AMENTA^CEÆ.

Genera 16, Species 385; Hot-house Species 6; Green-house Species 21; Hardy Ligneous Species 358; Hardy Herbaceous Species 0. † 252 feet; ‡ 0 feet; ≃ 0 feet.

Here is the group in which all the timber trees of Europe, and most of those of all cold countries, are stationed. Every genus consists of plants important to the wants of man. The alder, the birch, the willow, the poplar, the oak, the chestnut, the hornbeam, and the plane, are all collected in this place, to which they have been brought by the coincidence of similar fructification existing in all of them. This similarity depends upon their producing flowers of one sex only, the males of which are always arrayed in catkins, of which the flowers are destitute of calyx or corolla, in the place of which is produced a single scale. Their bark is furnished with an astringent principle, which has rendered them valuable either for staining black, as in the alder and the oak gall; or for tanning, as in the oak; or as febrifuges, as the alder, the birch, the oak, most of the willows, and also *Pòpulus tremuloides*, which is well known in North America as a tonic and stomachic febrifuge. The substance called *tacamahaca* was formerly supposed to be produced by some of the poplars, but it is now believed to be obtained from a very different plant, *Fagàra octándra*. The fruit of many *Amentacæ* contains a considerable proportion of *fæcula*, which renders it fit for the food of man and other animals, as the acorns of the oak, the mast of birch, the nut of *Castànea* and *Còrylus*, &c. Layers and seeds.

|-------------------------|---|---|----------------------------|---|---|

423. ORDER CLXXVI. CONIFERÆ.

Genera 17, Species 145; Hot-house Species 6; Green-house Species 29; Hardy Ligneous Species 110; Hardy Herbaceous Species 0. ‡ 166 feet; † 0 feet; ≍ 0 feet.

These bear the same relation in point of consequence to resinous trees, that *Amentaceæ* bear to those that are not resinous. They are well known as lofty timber, yielding valuable wood and abundance of resin. Among them is now numbered the loftiest tree in the world, a species of pine found by Mr. Douglas in California, which grows 230 feet high, with a circumference of 60 feet. Pitch, turpentine, Venice turpentine, are produced by various species. Gum Sandarach, by *Thûja quadrivalvis*; a matter like olibanum, by *Juniperus lycia*; a sort of liquid storax, by *Altingia excelsa*. The *Juniperuses* in which the resin is "incompletely oxygenised" are more fragrant, and also stimulating in a greater degree; as the *savin*, for example. The berries of many of these plants possess similar qualities. Their seeds are all oily; those of *Pinus Pineæ*, *Cembra*, and *Lambertiana*, and *Salisbûria adiantifolia*, are eatable as nuts. The fleshy fruit of the yew, which is poisonous, is an exception to the general innocuous character of the order. *Coniferæ* are mostly inhabitants of the northern parts of the world, where they form immense forests, and supply with their dense persistent leaves the place occupied by the evergreen trees of warmer climates. A few are found in the southern hemisphere. Layers and seeds, sometimes by cuttings.

|--------------------------|-------------------------|----|---|---------------------------|---|---|

CLASS II. MONOCOTYLEDONEÆ, or ENDOGENÆ (*endon*, inside, *geinomai*, to grow).

Genera 630, Species 4702; Hot-house Species 1325; Green-house Species 1322; Hardy Ligneous Species 34; Hardy Herbaceous Species 2021. ‡ 16½ feet; † 93½ feet; ≍ 17 feet.

The physiological peculiarities of this class of plants have been already explained in the general remarks which precede this arrangement of natural orders. To what is there stated, little remains to be added, except that in these northern regions, every thing included in it is herbaceous, and that in hotter latitudes, few deserve the name of either bush or tree, except the palms, and a few *Arôideæ* and *Asphodèleæ*.

428. ORDER CLXXVIII. CYCADEÆ.

Genera 2, Species 26; Hot-house Species 19; Green-house Species 7; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ‡ 0 feet; † 0 feet; ≍ 0 feet.

The true station of this very curious order is extremely uncertain. Although placed here in conformity with the common practice, it is to be supposed that its true station is in the immediate vicinity of ferns, with which the species agree in veneration, and in many curious particulars. All are natives of countries beyond the reach of frosts, chiefly of the Cape of Good Hope and equinoctial America. With a low trunk, which rarely exceeds the height of a few inches, they have the fronds and appearance of pygmy palms, and the inflorescence of gigantic Equisetums. The trunk of *Cycas* contains a great quantity of fecula, which is manufactured into a kind of spurious sago; and a similar substance, it has lately been ascertained, may be obtained from the stem of *Cycas*. (*Gard. Mag.*, vol. iv.) Scales.

Fine water plants, of which *Bùtomus*, by general consent the most beautiful of British plants, has purple flowers; and *Limnòcharis*, a native of the marshes of Brazil, has yellow ones. Division and seeds.

1234 *Bùtomus L.* \*0 2 | 1558 *Limnòcharis Bonp.*

## 432. ORDER CLXXXII. JUNCAGI'NEÆ.

*Genera 2, Species 8; Hot-house Species 0; Green-house Species 2; Hardy Ligneous Species 0; Hardy Herbaceous Species 6.* † 0 feet; ‡ 6 feet; ≧ 0 feet.

Insignificant bog plants, with grassy leaves, and central spikes or racemes of greenish yellow flowers. Divisions.

1106 *Scheuchzèria L.* \*0 1 | 1107 *Triglòchin L.* \*0 5

## 433. ORDER CLXXXIII. ORCHI'DEÆ.

*Genera 111, Species 425; Hot-house Species 214; Green-house Species 111; Hardy Ligneous Species 0; Hardy Herbaceous Species 100.* † 0 feet; ‡ 15 feet; ≧ 0 feet.

Of all tribes of plants, this is the most singular, the most fragrant, and the most difficult of culture. The flowers are often remarkable for their grotesque configuration, which has been likened to heads and bodies of animals, and for the strange character of their stems, which are sometimes attenuated into a degree of gracefulness scarcely equalled even among grasses, and sometimes contracted into a clumsy guttiness of figure such as is known no where else. The species are found inhabiting the mountains and meadows of the cooler parts of the globe, or adhering by their tortuous roots to the branches of the loftiest trees of the tropical forest, to which their blossoms often lend a beauty not their own. Vulgarly, this last description of plants is called parasitic; they are, however, not so, deriving no support from the juices of the plants on which they grow; but, on the contrary, are epiphytes, merely adhering to other plants for support, and vegetating amidst the rich black soil which collects at the foot of all trees growing in a hot humid climate. It is very singular, that the pollen of these plants has no parallel, except among the very different and distinct order of *Asclepiàdeæ*. The only medicinal properties of the order exist in the roots of some of the Orchises, from which the nutritious substance called salop is prepared. The Vanilla of the shops is the pod of the genus called *Vanilla*. From the boiled stems of some of the Brazilian species a tenacious glue is obtained, which is employed in many useful purposes. Division and offsets.

442. ORDER CLXXXIV. SCITAMINEÆ.

Genera 11, Species 126; Hot-house Species 124; Green-house Species 2; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♀ 0 feet; ♂ 0 feet.

These are distinguished from the last by their pollen not cohering in masses, their seeds not being winged, and their plurilocular ovary. Their sensible qualities are also widely different. The species are natives only of the tropical parts of the world, where they form stemless or caulescent herbaceous plants, with long broad leaves, and flowers of white, yellow, or red, often possessing great fragrance, and generally much beauty. Their sensible qualities reside either in the root or the seeds. The former is the part used of the ginger, the galangale, the costus, turmeric, zedoary, and others, all of which are more or less aromatic. The root of turmeric is also well known as affording a yellow dye, a property which it possesses in common with some others. The seeds of cardamom are well known for their aromatic stimulating powers. Division and offsets.

443. ORDER CLXXXV. CANNINEÆ.

Genera 5, Species 81; Hot-house Species 80; Green-house Species 1; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♀ 0 feet; ♂ 0 feet.

Differing from the preceding, in the absence of aromatic principles, in the petaloid nature of the filament, and the single cell of their anther, they wholly resemble them in external appearance and geographical distribution. The Cannas are well known for their beautiful flowers, and the Maránta arundinacea is celebrated for the abundance of nutritive facula which is prepared from it, and imported to Europe under the name of arrow-root. Division.

|               |              |                 |

| 5 Phrynium L. | 1 Cánna L.   | 3 Calathöa Mey. |
| 4 Thalia L.   | 2 Maránta L. |                 |

444. ORDER CLXXXVI. MUSA'CEÆ.

Genera 4, Species 28; Hot-house Species 28; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♀ 0 feet; ♂ 0 feet.

A noble order of plants, resembling the last two in appearance, but of far more gigantic stature, different geographical distribution, and sensible qualities. All the species, without exception, are among the grandest in the vegetable world, whether the breadth and beauty of their foliage, or the surpassing grandeur of their flowers be considered. They are not, like Scitamineæ and Cannæ, confined to the tropics, but approach in many points towards the cooler latitudes of either hemisphere. While the Strelitzias, resplendent with orange and scarlet and white, are peculiar to the Cape of Good Hope, the plantain is laden with its enormous masses of wholesome pleasant fruit, in the mild climate of Madeira; the Heliconias and Uranias appear in the sultriest forests of Madagascar and Guiana. The fruit of the Mûsa is, as just stated, pleasant and wholesome; the leaves of the same plant form a valuable thatching for cottages; and the fibres of a particular species are manufactured into a fine hemp, from which the most delicate muslins of India are prepared. Offsets.

| 946 Uránia Schr. | 745 Helicönia L.     |

445. ORDER CLXXXVII. IRIDEÆ.

Genera 36, Species 419; Hot-house Species 9; Green-house Species 282; Hardy Ligneous Species 0; Hardy Herbaceous Species 128. ♀ 0 feet; ♀ 24 feet; ♂ 0 feet.

The peculiarity of this order exists in the superior six-cleft perianthium, three stamens opposite the outer segments, and the anthers so inserted that the line of their bursting is towards the outside of their flower. Occasionally, they are still called by the old appellation of Ensätæ. Most of the species are extremely beautiful; and as they are generally very easily cultivated, they have become universal favourites in gardens. Many of the species are found by the side of streams, or in rich pastures, in Europe, Siberia, and America; others adorn the most barren deserts of the same countries with their perishable flowers; a third set, consisting for the most part of Sisyrinchium and its allies, are found in cool parts of the islands in the South Seas; and, lastly, a large proportion of the order contributes to the herbage of Southern Africa that indescribable charm which has captivated all observers. Their medicinal virtues are trifling. Iris florentina and germanica have roots which, when dry, smell like violets, and are slightly stimulant, acting as sternutatories or purgatives, according as they are employed. The stigmas of the Crocus form the well-known saffron, which differs from the general character of the order, in being aromatic, and possessing a valuable coloring matter, which has the singular property of entirely disappearing under the influence of the sun's rays. Division, offsets, and seeds.

446. ORDER CLXXXVIII. HÆMODORACEÆ.

Genera 10, Species 24; Hot-house Species 3; Green-house Species 20; Hardy Ligneous Species 0; Hardy Herbaceous Species 1. ♀ 0 feet; ♀ 2 feet; ♂ 0 feet.

The name of this order, derived from haima, blood, indicates its most striking peculiarity; the roots of several species of Hæmodorum, Wachendörfia, and Heritiëra, yielding a brilliant crimson dye. The species have equitant leaves, and six stamens, with anthers turned towards the ovary; in which last character they differ from the closely allied order of Irideæ. They are found, with very few exceptions, in the Cape of Good Hope and New Holland. Division and offsets.

## 448. ORDER CXC. AMARYLLIDEÆ.

Genera 30, Species 464; Hot-house Species 198; Green-house Species 138; Hardy Ligneous Species 0; Hardy Herbaceous Species 128. † 0 feet; ‡ 20½ feet; ≅ 0 feet.

Here we have another group of vegetation so lovely as to have excited admiration from the days of Solomon, who called them the lilies of the field, down to our own period. Their roots are all bulbous. In stature they seldom exceed a foot or two: in Doryánthes, and some species of Crinum alone, much surpassing such a size; in foliage they possess a uniformity of figure which is very singular; in colour they vary from white and yellow to deep scarlet and azure blue; in fragrance they vie with the violet and the primrose. Some of the species are natives of thickets in the cooler provinces of Europe and Asia; others are found deep-rooted in the burning shores of islands where scarcely a blade of grass interposes itself between them and the torrid rays of a scorching sun; many spring up in the gloomy, damp, and sultry woods of equinoctial America; and another set intermingles with the Ixias and Gladioluses of Southern Africa. Several of the Narcissi, independently of their beauty, possess emetic qualities; from the viscid juice of Brunsvigia toxicària, the Hottentots procure a poison wherewith to smear their arrows. Offsets and seeds.

|                        |     |                       |     |                      |       |

## 449. ORDER CXCI. HEMEROCALLIDEÆ.

Genera 18, Species 261; Hot-house Species 14; Green-house Species 238; Hardy Ligneous Species 0; Hardy Herbaceous Species 9. † 0 feet; ‡ 6½ feet; ≅ 0 feet.

These are fine showy plants, bearing their flowers in umbels or racemes, either white, yellow, red, or blue; they are mostly inhabitants of temperate zones, and are of little utility, with the exception of the aloe, the purgative powers of which need not be insisted on. This genus is, besides, remarkable among Monocotyledones for its fleshy leaves, in which, and its woody stem, it offers a striking deviation from the usual structure of these plants. Cuttings, offsets, and division.

## 451. ORDER CXCIII. TAMÈEÆ.

Genus 1, Species 2; Hot-house Species 0; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 2. † 0 feet; ‡ 3 feet; ≅ 0 feet.

Twining herbaceous plants, with large tuberous roots, heart-shaped leaves, and racemes of small axillary flowers. The roots are purgative and dangerous. Roots and seeds.

|               |      |
|---------------|------|
| 2784 Tàmus L. | *0 2 |
|---------------|------|

## 452. ORDER CXCIV. SMILACEÆ.

Genera 12 Species 103; Hot-house Species 12; Green-house Species 17; Hardy Ligneous Species 25; Hardy Herbaceous Species 49. † 10½ feet; ‡ 12 feet; ≅ 0 feet.

These scarcely differ from the baccate Asphodèlææ, except in their usually trifid style, and the membranous integuments of the seed. Many are interesting plants, especially the lily of the valley, a species of Convallària, the odour of which is perhaps the most grateful in the vegetable kingdom. Several others, as Uvulària, Smilacina, Polygónatum, and Trillium are objects of ornament. Smilax is remarkable for its twining stems, and its leaves, which resemble those of Dicotyledones; the roots of several species form the sarsaparilla of the shops, a drug, the nature of which is mucilaginous and rather bitter, and which is employed as diaphoretic and diuretic. Medòola is also an active diuretic. Suckers, cuttings, division, and offsets.

|                        |       |                      |      |                        |      |

453. ORDER CXCV. ASPHODELEÆ.

Genera 51, Species 519; Hot-house Species 32; Green-house Species 267; Hardy Ligneous Species 0; Hardy Herbaceous Species 220. ♂ 0 feet; ♀ 29 feet; ± 0 feet.

Different from Hemerocallidæ in their expanded flowers and dark crustaceous seed-coat; the only characters which have yet been discovered to distinguish them. The species are all pretty, many very handsome, some bulbous, some with fasciculated roots, a few with arborescent stems. They are uncommon in tropical countries, very abundant in temperate latitudes, and not infrequent in the cooler regions of the world. Among the prettiest are *Gagea*, *Scilla*, and *Hyacinthus*; the least interesting are *Chlorophytum* and *Zuccagnia*. *Asparagus* and *Dracæna* have berried fruits; the former is diuretic, and when young is employed as a favourite food; the same properties are possessed by *Scilla* and *Allium*. The stems of *Arthropodium* are remarkable for their tuft of yellow hairs, of *Dianella* for the thickening of the filaments. Many of the *Alliums* are very pretty, and admired notwithstanding their unpleasant odour; their roots are all eatable, and those of some among the most useful articles of food. *Thysanotus*, the fringed violet of New Holland, has rich purple blossoms, with long delicate fringes which sparkle in the sun, as if continually bedewed with minute particles of water. From *Phormium tenax* the strong fibrous substance called New Zealand flax is prepared. *Xanthorrhæa* has an arborescent stem which abounds in resin. Offsets and cuttings.

454. ORDER CXCVI. TULIPACEÆ.

Genera 8, Species 112; Hot-house Species 3; Green-house Species 12; Hardy Ligneous Species 9; Hardy Herbaceous Species 88. ♂ 12½ feet; ♀ 23 feet; ± 0 feet.

It is doubted whether several of the preceding orders are not rather sections of this; until, however, the combination of these shall be effected by some hand yet more masterly than those by which they have been divided, it is best to let them remain as they are. The beauty of the plants composing the *Liliacæ*, strictly so called, is universally acknowledged; the rich colors of the branching lilies, the vivid hues of the painted tulip, the modest graces of the humble *Erythronium*, and the portly forms of the *Yuccas* are all attractions of which no good garden should be destitute. The species are all inhabitants of either cold or temperate latitudes. Offsets.

455. ORDER CXCVII. MELANTHACEÆ.

Genera 22, Species 73; Hot-house Species 2; Green-house Species 25; Hardy Ligneous Species 0; Hardy Herbaceous Species 46. ♂ 0 feet; ♀ 13 feet; ± 0 feet.

These, too, are pretty herbs, although destitute of the grandeur of the preceding, which, however, they far surpass in the potency of their virtues. The flowers of many are inconspicuous, and of a dull green or yellow color, sometimes assuming a livid hue, which will bespeak the nature of their powers. A dangerous or poisonous acrid juice is their characteristic, which is particularly active in some of them, such as the *Cólchicum* and *Verátrum*. The roots of the former are the basis of the *eau médicinale*, and are now used in cases of gout with much success. The root of *Verátrum* is believed to have been the *heleboro* of the ancients, an active drug, which, administered in small doses, is a drastic purgative, in more abundance a violent emetic. The root of *Anguillária dioica*, infused in water, is anthelmintic, but, steeped in spirits, yields a bitter and tonic tincture. The leaves of *Cólchicum* and *Verátrum* often produce vomiting and severe pain in the animals that eat them; the flowers of the first are also said to be poisonous, and its seeds to possess the same properties as the roots, but in a milder degree. Groves and pastures in Europe and Siberia and North America are the most frequented by *Melanthacæ*, several are found at the Cape, and *Gloriösa* is a native of the woods of middle Africa. Division and offsets.

456. ORDER CXCVIII. BROMELIACEÆ.

Genera 12, Species 100; Hot-house Species 96; Green-house Species 4; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♂ 0 feet; ♀ 0 feet; ± 0 feet.

Of these the eatable pine-apple is the representative, from which the other genera differ more in the want of a fleshy fruit than in general appearance. Their habit is acid, their leaves rigid and toothed with spines, and covered with minute scales, their bractæa often colored with scarlet, and their flowers either white or blue. They are all natives of tropical countries, with the exception of *Tillándsia*, which, in the humid woods of Carolina, forms dense festoons among the branches of the trees; this, like many others of the order, is an epiphyte, vegetating among the black mould that collects upon the bark of trees in hot damp countries; others are inhabitants of deep and gloomy forests; and others form, with their spiny leaves, an impenetrable herbage in the extensive pampas of Buenos Ayres and Brazil. From the *Agave mexicana* a fermented beverage is prepared, from which a strong colorless spirit, resembling the best Scotch whisky, is distilled. Suckers and crowns.

## 457. ORDER CXCIX. PONTEDE'REÆ.

Genera 3, Species 10; Hot-house Species 5; Green-house Species 1; Hardy Ligneous Species 0, Hardy Herbaceous Species 4. ♀ 0 feet; ♂ 0 feet; ± 6 feet.

Elegant aquatic plants, usually with cordate kidney-shaped leaves, and central spikes or racemes of blue flowers. Natives of North and South America. Division and offsets.

959 Pontederia L. 0 2 | 135 Heteranthera Beauv. 0 1 | 134 Leptanthus Mz. 0 1

## 458. ORDER CC. COMMELINEÆ.

Genera 8, Species 71; Hot-house Species 41; Green-house Species 13; Hardy Ligneous Species 0; Hardy Herbaceous Species 17. ♀ 0 feet; ♂ 9 feet; ± 0 feet.

Mostly inhabitants of marshy ground in either hemisphere, but not known in Europe except in cultivation; America is their grand station. Many are elegant plants, usually with blue, reddish, or white flowers. Dichorizandras are exceedingly noble caulescent plants, with large thyrses of blue flowers: this color is the prevailing one of the order. Division, seeds, and offsets.

## 459. ORDER CCI. PALMÆ.

Genera 40, Species 130; Hot-house Species 119; Green-house Species 11; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

These were well named by Linnæus the princes of the vegetable world; for they far surpass all other plants in the grandeur and majesty of their port. Their lofty stem, supported by a mass of fibrous roots, which frequently creep along the surface of the ground, consists of wood with longitudinal fibres, soft in the centre, but hard as horn itself at the circumference; it is always unbranched, bearing a tuft of leaves at the summit; always round, and it terminates by a single bud; by the fall of the petioles of the leaves, which sheathe it in a greater or less degree at the base, it is covered with large scars. The leaves, technically called fronds, are usually pinnate or flabelliform, seldom simple; and, in a young state, before they expand, they are folded up in plaits from the base to the apex. The flowers are small, with bractæ at their base, either sessile or seated in some cavity, of a pallid color, and contained in a large bag called a spathe; when they open, the mass of inflorescence, called a spadix, bursts suddenly through the under side of the spathe, generally evolving the most fragrant odors. Impregnation takes place rapidly, through the injection of the pollen upon the humid surface of the stigmas, which gape open to receive it. The fruit is perfected in a period varying from six months to a year; when ripe it is a drupe or berry, with either a fibrous or fleshy coat; the mass of its kernel consists of oily albumen, which, in the case of the cocoa nut, is soft enough to be eaten, but which in most species is as hard as horn. Dr. von Martius, the celebrated traveller in Brazil, to whom the world is indebted for nearly all that is known of these plants, concludes his remarks upon the characters of the order in the following words:—"Palms, the noble offspring of Terra and Phœbus, are natives of those happy countries within the tropics, where the rays of the latter are ever beaming. In all such climates they are to be found, with this limitation, however, that in the southern hemisphere they do not overstep the 35th degree of latitude, nor in the northern the 40th. Most species are confined within fixed and narrow bounds; for it comes to pass that wherever a district is characterised by striking peculiarities of soil or climate, those species exist which are not found elsewhere; but few, on the contrary, extend over a large extent of surface, as the Cocos nucifera, Acrocodmia sclerocarpa, Borassus flabelliformis, &c. It is probable that the number of palms existing on the face of the earth, will be found by future travellers to amount to as many as a thousand species. Most of them love the margins of springs and streams, but few establish themselves on the shores of the ocean, and yet a smaller number ascend into the alpine regions of their country; some collect in large forests; some are scattered singly or in clusters among woods and plains. In the most ancient periods of the world, when the genera of plants were beginning to be formed, palms scarcely existed; they were preceded in the creation by the more ancient Ferns, Cycadæe, Grasses, and Equisetæe. Some of their remains have, however, been found in variegated sandstone, and in limestone of the third order (fletzalk), part of which belong to unknown species, and part to species still in existence. But in the times succeeding the deluge, they appear, from the written evidence of historians and poets, to have followed the footsteps of man, to whom their fruit yielded food, drink, and oil; their stems houses, arms, utensils, flour, and wine; and their leaves cordage, and roofs for habitations. In cultivation their soil should be slightly saline; they are propagated by seeds more readily than by truncheons of the stem; when cultivated they undergo no alteration, except in producing more fleshy or stemless fruit: it is extremely difficult to transplant them beyond their own country; naturally their migration is absolutely opposed by the barriers of the ocean." Seeds.

## 460. ORDER CCII. PANDA'NEÆ.

Genera 2, Species 21; Hot-house Species 21; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

With the habit of palms, and the inflorescence of Arôideæ, this fine order stands very distinctly separated from all others. The stem is an arborescent caudex, usually growing to a considerable height. The leaves of some are formed into a coarse cordage; the flowers of *P. odoratissimus*, and the fruit of some others, are eaten. All are tropical. Cuttings.

2730 Pandanus L. fil. | 2816 Phytéphas R. & P.

## 461. ORDER CCIII. TYPHINÆ.

Genera 2, Species 8; Hot-house Species 0; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 8. ♀ 0 feet; ♂ 0 feet; ± 7 feet.

Reed-like plants, common every where throughout the world in lakes and ditches, usually with strong creeping roots, and long soft, or round prickly catkins of inflorescence. All natives of Britain. Roots and Divisions.

2597 Typha L. \*0 4 | 2598 Sparganium L \*0 4

462. ORDER CCIV. AROFDEÆ.

Genera 18, Species 122; Hot-house Species 91; Green-house Species 10; Hardy Lignous Species 0; Hardy Herbaceous Species 21. ♀ 0 feet; ♂ 9½ feet; ± ¼ feet.

Herbaceous, stemless, or caulescent plants, with broad fleshy leaves, approaching very nearly to those of Dicotyledons. Their flowers are enclosed within a spathe, and are embedded on a simple cylindrical spadix. Some are natives of Europe and of similar latitudes, but the greater number inhabit the tropics, where they often climb by their rooting stems to the tops of lofty trees. They have thick fleshy roots, which, when fresh, contain an acrid stimulating principle, which is so volatile that it passes off freely upon the application of heat; whence the roasted roots of many species are among the most common articles of negro food. The leaves of *Arum* squigum are so paralyzing, that if chewed they deprive one of the power of utterance; whence in the West Indies it is called the *dumb cane*; the leaves of *Calla pertusa* are acrid; fresh gathered, and applied all over the surface of the body, they produce a slight inflammation and blistering, and are used in Demerara by the natives in dropsical cases. The root of *Arum triphyllum*, boiled in milk, has been found efficacious in consumption. The flowers of many species are highly fetid. Division and offsets.

466. ORDER CCV. FLUVIÆLES.

Genera 7, Species 27; Hot-house Species 2; Green-house Species 2; Hardy Lignous Species 0; Hardy Herbaceous Species 23. ♀ 0 feet; ♂ 0 feet; ± 4 feet.

With these the Vasculæres and Monocotyledones terminate: it has long been apparent that we have been descending in the scale of vegetation; and, hence, the last order exhibits a structure the most simple of all vascular plants. In the present order, *Zosteræ* and *Ruppia* are so closely allied to *Alga*, that they may be mistaken for them. Offsets and division.

467. ORDER CCVI. JUNCEÆ.

Genera 7, Species 72; Hot-house Species 1; Green-house Species 10; Hardy Lignous Species 0; Hardy Herbaceous Species 52. ♀ 0 feet; ♂ 1¼ feet; ± 0 feet.

Inconspicuous, rigid, worthless weeds, for the most part; *Xyris*, *Phylidrum*, and *Narthecium* which have pretty yellow flowers, if belonging to the order, being exceptions. They decline barren ground in most parts of the world, and are the first approach to the formation of a regular perianthium, as we ascend in the scale of vegetation. *Xérotis* has the habit of a low palm. Division and seeds.

468. ORDER CCVII. GILLIESIÆ.

Genus 1, Species 1; Hot-house Species 0; Green-house Species 0; Hardy Lignous Species 0; Hardy Herbaceous Species 0. ♀ 0 feet; ♂ 0 feet; ± 0 feet.

An inconspicuous grass-like plant with greenish yellow flowers. Native of Chile. Division.

1285 *Gilliesia* Lindl.

469. ORDER CCVIII. RESTIÆ CÆL.

Genera 9, Species 29; Hot-house Species 3; Green-house Species 25; Hardy Lignous Species 0; Hardy Herbaceous Species 4. ♀ 0 feet; ♂ 1½ feet; ± ¼ feet.

Rigid, inelegant, often leafless plants, with split vagina, and the habit of some Cyperaceæ, or true Juncæ. They are all inhabitants of the southern hemisphere, especially of the Cape of Good Hope and New Holland. Division and seeds.

|                                |     |                                |                                 |

470. ORDER CCIX. CYPERÆ CÆL.

Genera 25, Species 269; Hot-house Species 44; Green-house Species 24; Hardy Lignous Species 0; Hardy Herbaceous Species 301. ♀ 0 feet; ♂ 3¼ feet; ± 4 feet.

The sedges, as these may be called in English, differ from grasses not only in their comparative worthlessness, and the different development of the parts of fructification, but also in the sheath, at the base of the leaves, being closed up, not slit. As objects of ornament they are of no value, and as subjects of agricultural interest but little; they are, moreover, of little utility to man. They are chiefly valuable for covering, with the appearance of herbage, waste and barren marshy or sandy tracts, in which little else will thrive. The roots of *Carex arenaria*, *disticha*, and *hirta*, possess diaphoretic and emollient properties, whence they are sometimes called German sarsaparilla. Some of the Scirpuses and Cyperuses have eatable nutty roots; the stems of *Scirpus lacustris*, *Eleocharis palustris*, *Cyperus textilis*, and others, are manufactured into mats and the bottoms of chairs; the roots of *Cyperus esculentus* abound in oil, a very unusual circumstance; the papyrus of the ancients was manufactured from the stem of *Papyrus antiquorum*; finally, the roots of *Cyperus longus*, *odoratus*, and others, are fragrant. Division and seeds.

## 471. ORDER CCX. GRAMINEÆ.

Genera 158, Species 1071; Hot-house Species 119; Green-house Species 59; Hardy ligneous Species 0; Hardy Herbaceous Species 893. † 0 feet; ‡ 67 feet; § 9 feet.

The order of grasses is beyond doubt the most natural of all that the ingenuity of systematic botanists has contrived; it is also the most numerous in species. The inflorescence is very much alike throughout the orders; and the floral envelopes, which are bractæ in a progressive state to the form of calyx and petals, offer few striking characters by which the genera can be characterised. Hence it is that the classification of the order, and its division into genera, has not only been found extremely difficult, but has given rise to much difference of opinion among botanists; some of whom, adhering to the synthetical arrangement of Linnæus, admit but a small number of genera, while others, admitting the analytical principles of modern science, divide it into a vast number. The middle course in this, as in most other cases, is probably the just one. A subdivision of the order into tribes has been attempted by Palisot, Trinius, Dumortier, Raspail, Kunth, Link, and others; that of Link is here adopted. The general habit of grasses is so familiar to every one, that it may be passed over in silence. They are remarkable for exhibiting, in no case, properties that are actually poisonous; possessing on the contrary, in almost all cases, wholesome and nutritive qualities. These latter are especially obvious in their seeds, which always contain a farinaceous substance, mixed with a certain proportion of glutinous matter. No one is ignorant of the various and important uses of the seeds of wheat, rye, barley, oats, maize, rice, and others, and in general of all the larger kinds of grass. It must however be remarked, that if the smaller sorts are not employed in like manner, it is merely on account of their minuteness, and not on account of any difference in their nature; in fact, in times of scarcity, and in half-cultivated countries, use has advantageously been made of *Glycèria fluitans*, *Zizania aquatica*, *Avèna fàtua*, *Digitaria sanguinalis*, *Arrhenatherum avenaceum*, *Bròmus secàlinus*, and *Elymus arenarius*. It is also to be noted, that the particular uses for which the seeds of certain grasses are employed, are not peculiar to them, but may be obtained from all the others, with slight modifications. Thus beer is made not only from barley, but also from wheat; spirituous liquors not only from our European cerealia, but also from rice. But it must be remarked, that a singular exception to the generally wholesome properties of grasses appears to exist in *Lolium temulentum*, the seed of which is reported to be narcotic and inebriating, and even poisonous; there is no doubt, however, that these qualities have been greatly exaggerated; for, in the first place, they disappear in bread or beer manufactured from *Lolium temulentum*; and secondly, in times of scarcity people have frequently lived upon it. But even supposing all that has been stated upon the subject to be true, this plant will still be found to be little different from wheat, when long exposed to wet; so well, indeed, is this known by country people, that a belief exists, that in wet summers wheat is actually transmuted into rye grass. The exciting properties of the oat, which are very unusual in this order, have been found to reside in the husk and not in the seed, and to depend upon the presence of a minute quantity of an aromatic principle, analogous to Vanilla, lying embedded in the envelope of the seed, and capable of being extracted by aid of alcohol. As to the deleterious effects of the ergot of rye, these do not depend certainly upon any such property in the rye itself, but is caused either by the ergot disease, or, as is believed, by the parasitic fungus, from the attack of which it arises. Now let us pass from the seeds of Gramineæ to their stems, and we shall find a no less remarkable uniformity of nature in them. They all contain, especially before flowering, a sweet sugary mucilage, which varies in quantity in different species. The sugar cane, in which this is found in greatest abundance, not only constantly exists in the most favourable condition for producing it, as it rarely flowers, but is also one of the largest grasses known. The maize also abounds in sugar; and the same substance is secreted in such abundance by the *Sorghum saccharatum*, that attempts have actually been made in Italy to cultivate it as the sugar cane. The creeping roots of grasses, which are generally mucilaginous and demulcent, are sometimes used in medicine; but they are of more importance for retaining in banks the sand of the sea shore, so as to form artificial cliffs on flat coasts, to restrain the inroads of the sea. The stems of *Cymbopogon Schœnanthus*, the leaves of *Andropogon citratus*, the roots of *Andropogon Nardus*, and the whole plant of all the species of *Anthoxanthum* exhale an aromatic odour, and possess slightly tonic properties. To conclude, the epidermis of grasses has been found to contain a considerable quantity of silex. Division and seeds.

SECOND GRAND DIVISION, CELLULARES.

Genera 576, Species 2859; Hot-house Species 202; Green-house Species 84; Hardy Ligneous Species 0; Hardy Herbaceous Species 2573. ♀ 0 feet; £ 21 feet; ± 2 feet.

The characteristics of this division have already been explained in the preliminary observations upon the natural orders; and the remarks which were required for each natural order of Cellulares have already been given in Cryptogamia in the body of the work. It has, therefore, been thought advisable to adopt from Professor Agardh such observations as he has made upon the orders, as a sort of contrast to those already given.

CLASS I. FOLIA CEÆ.

Genera 103, Species 837; Hot-house Species 202; Green-house Species 84; Hardy Ligneous Species 0; Hardy Herbaceous Species 127. ♀ 0 feet; £ 21 feet; ± 2 feet.

502. ORDER I. FVLICES.

Genera 53, Species 380; Hot-house Species 201; Green-house Species 82; Hardy Ligneous Species 0; Hardy Herbaceous Species 97. ♀ 0 feet; £ 19½ feet; ± 0 feet.

Of these the stem is perennial, often subterraneous and creeping, and occasionally becoming arborescent and leafy above the ground. The fronds or leaves are usually pinnatifid, and more or less compound; sometimes nearly simple and entire, with reticulated veins. The capsules are minute, one-celled, seldom many-celled, brown, membranous, and surrounded by a thick articulated elastic ring, irregularly bursting, and either clustered on the lower surface of the frond, or compound in spikes. Their vernation is circinate, and some are propagated by bulbs. The old botanists denied any fruit whatever to Ferns; believing the seeds of these plants to be so rare as to invest any body with invisibility who could collect them. Afterwards, their capsules were believed to be their seeds. Linnaeus, and some others, doubted whether their fructification were seeds or pollen. Finally, the experiments of Ehrhart and Lindsay proved, beyond all cavil, that they were really seeds. As to the male organs nothing is known; some suppose them to be glands of the frond, others the elastic ring, some the indusium, and others the pores of the epidermis; lastly, Martius has supposed them to be the membrane including the spiral vessels. Ferns are chiefly inhabitants of the torrid zone, becoming rarer as we approach the poles. They delight in a humid soil, and they often grow parasitically upon trees. The medicinal virtues of some are highly astringent, of others anthelmintic, of others purgative; some have acquired celebrity for their pectoral, others for their corroborant, qualities. The young leaves and roots of some

constitute an article of food; beer is obtained from the roots of others; and, finally, *Aspidium fragrans* has been used as tea. Division and seeds.

## 508. ORDER II. EQUIRETACEÆ.

*Genus 1, Species 10; Hot-house Species 0; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 10. 1 0 feet; 2 6½ feet; 3 0 feet.*

Marsh plants, with a verticillate arrangement of their branches, and a highly indurated epidermis. Their seeds are remarkable for a hygrometrical movement. The quality of some is said to be hurtful to cattle, which is denied by others. Formerly they were used in medicine as astringents and diuretics. *Equisetum hyemale* has been employed for tea, and as a polishing material for furniture, under the name of Dutch rushes. Divisions.

2954 *Equisetum L. \*0 10*

## 509. ORDER III. LYCOPODINEÆ.

*Genera 2, Species 19; Hot-house Species 1; Green-house Species 2; Hardy Ligneous Species 0; Hardy Herbaceous Species 16. 1 0 feet; 2 4 feet; 3 1 foot.*

With the habits of mosses they have the seeds of ferns. They are herbaceous prostrate plants, with imbricated simple leaves. *Lycopodium complanatum*, *Selago*, and *clavatum* are used as dyes; the spores of *Lycopodium clavatum* are said to be employed for ameliorating wine, and are also used in making fire-works, on account of their inflammable nature. The herb of *Lycopodium clavatum* and *Selago* is emetic, and produces abortion. *Lycopodium Phlegmária* is reputed an aphrodisiac. Divisions.

2955 *Lycopodium L. \*0 16* | 2956 *Psilotum Swz.*

## 510. ORDER IV. MARSILEACEÆ.

*Genera 4, Species 4; Hot-house Species 0; Green-house Species 0; Hardy Ligneous Species 0; Hardy Herbaceous Species 4. 1 0 feet; 2 1 foot; 3 2 feet.*

Floating or erect simple-leaved plants of no known use. The Marsileas, which are to some countries what *Lémma* is to this, are not known in cultivation. Plants.

2957 *Isoetes L. \*0 1* | 2959 *Salvinia Mich. 0 1*  
2958 *Pilularia L. \*0 1* | 2960 *Marsilea L. 0 1*

## 511. ORDER V. MUSCI.

*Genera 37, Species 330.*

Winter plants, reviving in humid air, abundant about the poles, rare at the equator. They cover the mountains of the earth as high as the limits of perpetual snow; growing in patches, they clothe the most barren spots with verdure, preserve trees from heat and cold, prepare the earth for nourishing more perfect plants, and fill up bogs and morasses with vegetable matter. To the economy of nature they are, therefore, more subservient than to the purposes of man. Medicinal astringent properties were formerly ascribed to some few, but they are now neglected or forgotten.

## 512. ORDER VI. HEPATICÆ.

*Genera 6, Species 94.*

Creeping small plants, with their leaves arranged in an imbricated manner. They differ from Lichens in structure, color, and fruit; from *Músci*, in the dehiscence of their capsule. Their qualities are mild, if any; some of them are fragrant.

## CLASS II. APHYLLÆ.

*Genera 273, Species 2022.*

The genera under the following orders, being arranged under the same orders in the Linnean system, according to their natural affinities, are not here repeated.

## 513. ORDER VII. ALGÆ.

*Genera 79, Species 453.*

Plants ascending from the simplest form known in vegetation to a very compound state. The lowest are filiform, leafless, with their fructification immersed; the highest are leafy, with the fructification included in an indehiscent wart-like pericarpium. Some copulate like animals, others have a spontaneous motion like worms. Their color is lively, in the lowest grades green, in the highest red or purple. Some are ephemeral

and microscopical, annual or perennial, and others extend to the length of many fathoms. They grow at the bottom of the sea, or in fresh water, the depths of which they clothe with vegetation, as the higher orders of plants cover the earth with forests. They grow on stems in the water only, or on each other. Some exhale oxygen, others are scented like violets. Their taste is mild; their substance gelatinous, membranous, or coriaceous, usually covered externally with mucus. The structure of the lowest is articulated; of the highest fibrous.

## 514. ORDER VIII. LICHE'NES.

Genera 35, Species 412.

Lichens are not only most useful in the economy of nature, as preparing the surface of the earth for the reception of larger vegetables, but they are, moreover, of great utility to man. Many, as *Cetrària islàndica*, are eatable, having a bitter principle, and giving out a styptic tincture if immersed in alcohol. Others, steeped in urine or salts, are used for dyeing; crustaceous species of this kind are *Variolària oreina*, *Lecanòra tartàrea*, *Leprària chlorina*, &c.; foliaceous species, *Parmèlia saxàtilis*, *Sticta pulmònacea*, *Solorina crucea*, *Gyròphora deusta* and *pustulàta*, &c.; and branched kinds, *Roccella tinctoria* (the common Orchal), *U'snea plicàta*, *Alectòria jubàta*, and others. In medicine, *Cetrària islàndica* and *nivalis*, *Sticta pulmonacea*, *Alectòria muscoides* are tonic and nutritive; *Parmèlia parietina*, *Borrèra purpuracea*, *Evèrnia Prunàstri*, &c., are astringent and febrifugal; *Peltidea apthòsa*, anthelmintic; *Evèrnia vulpina*, poisonous. Some yield a gum, as *Evèrnia Prunàstri*; *Sticta pulmonacea* may be employed for bittering beer instead of hops, and *Ramalina scopulòrum* instead of soap. The various species give the grey hue to old walls and stones, cover desert heaths, and mottle the bark of ancient trees.

## 515. ORDER IX. FU'NGI.

Genera 159, Species 1157.

We have now reached the lowest station of vegetable existence, in arriving where the vesicles which compose the vegetable fabric are combined in various forms, according to the contingent circumstances under which they are developed. The mould on the cheese, the ergot of corn, the rust of the rose, and the huge *Bolètus*, which, in Java, spreads out its many-handed body from the trunks of ancient trees like a vegetating demon, differ only in the number of the vesicles of which they are composed. Many species are eatable, as *Agàricus campestris*; others are deadly, as *Bolètus scàber*: some are used medicinally, as *Dadàlea suavòlena* in coughs; *Agàricus tuba reginà* in diarrhœa; *Agàricus piperàtus* in calculous disorders; *Phàllus Mokisìn* against cancer; *Polýporus annòsus* against the bites of serpents. Some Coprini are used for healing ulcers; *Polýporus officinàlis* as a purgative; *Polýporus igniàrius* as a styptic; *Polýporus destròctor*, and a number of others, constitute dry rot. For the poison of fungi, the roots of garlic, the leaves of parsley, and tincture of lacmus, are said to be remedies; so also is common spirit. Fúngi swarm in all the coldest countries of the world, but as we approach the equator they are extremely rare; the place where they most flourish is Sweden, and the adjacent regions.

After the most perfect classification which the present state of botanical knowledge renders practicable, there still remain a few genera which are incapable of having their true station assigned to them, either in consequence of their structure being incompletely known, or of their affinity not having yet been discovered. As far as this work is concerned, they are the following, all of which are Dicotylédones.

3341 *Màrlea* Rox.

2731 *Trichócladus* Pers.

2994 *Laurophyllus* Thun.

\* \* \* THE foregoing Arrangement is founded on that given by Mr. Lindley in the *Encyclopædia of Plants*; but to suit it to the purposes of this Catalogue, it necessarily required a great many alterations and additions, for which Mr. Lindley is not responsible. — J. C. L.

 *The original Index, which occupied pages 546. to 576. inclusive, has been cancelled, and a new and more comprehensive one given, which will be found at the end of the Second Additional Supplement.*

FIRST  
ADDITIONAL SUPPLEMENT.

B.     | Sir Joseph Banks's Herbarium, preserved at the British Museum.                                                                                  |
| East. MSS. | Manuscripts of Mr. William Eames, a collector of plants in New Holland in 1827—1829.                                                | Hort. Doug. | Douglas's Herbarium, in the keeping of the Horticultural Society.                                                                               |
| Bertero.   | Carolus Joannes Bertero. Author of Specimen medicum nonnullas indigenas Stirpes continens exoticis succo-ganeas. 4to. Turini. 1811. | Jack.       | William Jack. A writer in the Botanical Miscellany of the plants of the Malay Islands.                                                          |
| Bigel.     | Jacob Bigelow, M. D. Professor of botany at Boston, U. S., and author of American Medical Botany, and of Florida Bostoniensis.      | Karstuss.   | G. Fred. Karstuss, M. D. Author of a work on Ferns, and demonstrator of botany at Halle. He died 1851.                                          |
| Bishop.    | David Bishop. Curator of the botanic garden, Belfast, and author of Causal Botany.                                                  | Leasing.    | C. F. Leasing. A writer on Compositæ, and resident at Berlin.                                                                                   |
| Booth.     | William Beattie Booth. Describer of the Camellias figured in Chandler's Illustrations of the Camellias.                             | Namour.     | H. Namour. A French botanist and traveller.                                                                                                     |
| Borrer.    | William Borrer. A writer on British plants, and one of the authors of Lichenographia Britannica.                                    | P. E. Webb. | Philip Barker Webb. A traveller in the Canaries, who sent thence species of plants not previously in British gardens.                           |
| Brec.      | W. T. Brec, A. M. A discriminative amateur botanist.                                                                                | Penny.      | George Penny. A L. S. Botanical cultivator in the Epsom Nursery.                                                                                |
| Calcy.     | George Calcy. For ten years a botanical collector in New South Wales, and afterwards curator of the botanic garden at St. Vincent.  | Racharás.   | John Racharás, M. D. A traveller in the northern parts of British America, and author of the Appendix on Natural History to Franklin's Travels. |
| Den.       | John Denison, A. L. S. Curator of the botanic garden, Bury St. Edmunds, from 1815, to 1829.                                         | Riedel.     | L. Riedel. A botanical collector attached to the botanic garden at St. Petersburg.                                                              |
| G Anders.  | George Andersson. Author of a monograph on Peonies, in vol. xlii. of the Linnæan Transactions, and a collector of willows.          | Savange.    | N. C. Savange. A Swiss writer on systematic botany in Decandolle's Prodrôme, &c.                                                                |
| G. E. Sm.  | Gerard Edwards Smith. Author of a Flora of South Kent.                                                                              | Tauk.       | Karsten Tauk. Professor of botany at Copenhagen, and a botanical author.                                                                        |
| Gow.       | J. R. Gowen. Originator of hybrid Azuleas and Rhododendrons at Earl Caernarvon's, at Highclere.                                     | W. & N.     | A. Weiche and Ch. G. Nees von Eschscholtz. Author of Buh's Germanien.                                                                           |
|            |                                                                                                                                     | Wray.       | Dr. Wray. Resident at Augusta, in Georgia.                                                                                                      |
|            |                                                                                                                                     | Zuccarini.  | G. Zuccarini. Author of a monograph on the genus Oxalis, and of other papers.                                                                   |

ADDITIONAL ABBREVIATIONS.

Hybrid. Known or presumed to be hybrid, but where raised not precisely known.  
 English hybrid, Scotch hybrid, &c. Hybrid, with the country in which it has been raised stated.  
 Gardens. Varieties which have appeared and are preserved in gardens.

# FIRST

## ADDITIONAL SUPPLEMENT.

• The alphabetic mode of arrangement has been adopted to avoid the necessity of a second Index. The number prefixed to each genus and species declares the relative place for each in the *Hortus*; and such genera as have not been inserted there have here a star, \* prefixed to them, their etymology given, and their Linnean class and order, and Natural order, stated. In the copies of the *Hortus Britannicus* which may hereafter be printed, stars will be inserted into the plates wherever the additions made in the Supplement come in, in order that the reader may be apprised of their existence, and lose as little time as possible in turning to them.

The species to which this character \* is prefixed are those which have been raised in the Exotic Nursery of Mr. Joseph Knight, King's Road, Chelsea, from seeds collected and brought home by Mr. Baxter. The names of these species have been verified and authenticated by Mr. Knight's very able and intelligent foreman, Mr. Alexander Scott, who, while he trusts that each may be found accurately denominated, nevertheless reminds us that Proteaceous plants are subject to great variation in foliage, in their progress upwards from a seedling state. Besides the above, Mr. Baxter's seeds have produced various other species of *Banksia* and *Dryandra*, and species of *Petróphila*, *Oxylobium*, *Mirbélia*, *Gompholobium*, *Hövea*, *Burtonia*, *Pultenæa*, *Brachysëma*, *Kennëdya*, *Daviësia*, &c.: many of which, when farther advanced in growth and age, may prove to be new species.

Whoever wishes to ascertain the additions and improvements made subsequently to the present *Additional Supplement* may consult the *Gardener's Magazine*; in which, under the article, which will henceforth be contained in every number, entitled, "Floricultural and Botanical Notices of New Plants, and of Old Plants of Interest, supplementary to the latest editions of the *Encyclopædia of Plants*, and of the *Hortus Britannicus*," will be found the name of every plant newly introduced or originated, and every recent improvement in botanical nomenclature. At the close of every year, or of every two or three years, according to the accumulation of matter, these names and improvements will be collected and published in additional Supplements similar to the present one.

| Systematic Name and Authority.                                                                                                          | English Name.                  | Health.        | Habitat in the Garden. | Popular Character. | Height in Feet. | Time of Flowering. | Colour of the Flower. | Native Country.  | Year of Introduction of Exotics, and Localities of British Species. | Propagation. | Soil. | Reference to Figures. |

- In the Gardener's Magazine, vol. vii. p. 62, we noticed, from the Botanical Register, t. 1336, the hybrid azaleas raised at Highclere from seeds of an autumnal-flowering kind, *A. nudiflora rubescens Hort.*, fertilised by the pollen of that variety of *A. calendulaea* which is known by the name of Lee's Triumphant, and we proposed to give the names of these in our Supplement. As some of these, however, have been subsequently published in the Botanical Register, and apparently not by the precise names which were first applied to them, we omit our tabular details of all that have not been separately published, and merely here register the names as first applied, which will at least show how many hybrids deemed distinguishable have been originated at Highclere: — *Cartonia*, *Gowenia*, *polyantha*, *basilissa*, *imperatrix*, *habrantha*, *habropis*, *chariessa*, *jasmynodora*, *sanguinea*, *Herbertiana*, *eugenes*, *euprepes*, *eudemon*, *calocoryphe*, *calostephane*, *calodendron*, *auronicta*, *aretincta*, *Auricæ*, *pontica*, *delicata*, *erythraea*, *calantha*, *ochroleuca*, *inclita*, *poikila*, *regia*, *dictatrix*, *pontica* versicolor, *pontica* expansa, and many others.

 28651 - - peduncularis *D. Don* long-pedunc.  $\frac{1}{2}$   $\square$  or 1 au Y Chile 1825. C s.l Bot. reg. 1392  
*Ledocarpon Desf.* pedunculare *Lindl.* in Bot. reg. 1392. *Cruickshanksia cistiflora Hook.* in Bot. mis. t. 90.  
 Mr. David Don remarks that *Cavanilles* founded this genus, and published it at Madrid in 1804, in the *Annales des Ciencias Naturales*. *Desfontaines* published it in 1818, by the name of *Ledocarpon*.  
 Mr. Brown has shown the genus *Balbisia* of Willdenow to be the same with *Linnaeus's* genus *Tridax*; consequently the law of priority, by which *Tridax L.* abrogates *Balbisia Willd.*, causes *Balbisia Cav.* to abrogate the genera *Ledocarpon Desf.* and *Cruickshanksia Hook.* Mr. Don refers this genus *Balbisia* to *Ficoideæ*, which he considers it connects with the small group *Reaumuriæ*.

| This is doubtless the variety which some denominate álba.                                                                                                                                                                                                                                                                                         |        |               |              |                                                          |                                                           |    |     |       |          |                  |            |       |                     |                       |      |
| "Those who retain Ficiaria as a genus should observe that Hudson's name véna, published in 1762, is prior to ranunculoides, and in every respect more eligible; the latter being a barbarous jumble of Latin and Greek, such as too often disgraces our science. It ought to have been ranunculinus." — Smith, in English Flora, vol. iii. p. 47. |        |               |              |                                                          |                                                           |    |     |       |          |                  |            |       |                     |                       |      |

 Wallichianum Lindl.  
 Its old leaves are glabrous, but those recently expanded are pubescent, as is, according to the figure in the Bot. reg., its calyx as well. The general smoothness which, in the open air of Britain, the plant assumes, led Professor Lindley to distinguish it from Mr. D. Don's pubigerum.

 Professor Lindley has remarked, Bot. reg. 1350., that he has proof that t. 1350. represents the L. pallida of Hortus Kewensis, which he identifies also with that of Thunberg; and he considers t. 314. or Bot. reg. to represent but a smaller variety of the same species; but remarks, "the supposed variety figured at t. 287. of this work is altogether another species." Agreeably with this view, a new specific epithet, with the name of its author, are wanting for No. 9015. of Hortus Britannicus.

|       |                         | In 1830, M. Decandolle sent to the collection of the Horticultural Society the following species of this genus; elongata, tenuis, echinaria, subangularis, subrotunda, intertexta, criniformis. These names are not in the Hortus Britannicus, and although some of the Cactean plants (see under <i>Cereus</i> and <i>Opuntia</i> ) sent by M. Decandolle may have died in the Horticultural Society's collection, yet, as they have possibly been also sent to other collections, it is deemed proper here to register the names, and the details relative to each will be supplied in a future Supplement. |                                                           |     |     |     |       |       |           |            |       |     |                         |                |

Cereus imbricatus Haw.

Plants of four species of this genus, under the names decipiens, Stapèlie, exuviata, and foliosa, were sent by M. Decandolle, in 1830, to the collection of the Horticultural Society. See under Mammi-laria, above.

Some novelties are anticipated in Low's Clapton Nursery, from seeds (many of which have germinated) recently collected in Chiloe by Mr. Anderson, who accompanied Captain King in the late expedition there. Novelties are also anticipated in various nurseries and gardens about London, from Chilean seeds purchased by various individuals of Mr. Cuming. Mr. Charlwood has also recently introduced various native plants of North America, collected there by Mr. Alexander Gordon, among which, besides rarities, there are probably novelties.

THE END.

SECOND  
ADDITIONAL SUPPLEMENT  
TO  
LOUDON'S  
HORTUS BRITANNICUS:

INCLUDING  
ALL THE PLANTS INTRODUCED INTO BRITAIN,  
ALL THE NEWLY DISCOVERED BRITISH SPECIES, AND ALL THE KINDS  
ORIGINATED IN BRITISH GARDENS,

UP TO  
**MARCH, 1839:**

WITH  
A NEW GENERAL INDEX TO THE WHOLE WORK,  
INCLUDING  
ALL THE SUPPLEMENTS.

---

PREPARED BY W. H. BAXTER, JUN., UNDER THE DIRECTION OF J. C. LOUDON;  
AND REVISED BY GEORGE DON, F.L.S.

- Laws.** *Charles Lawson.* Author of the Agriculturist's Manual.
- Lex.** *John Lexarza.* A French botanical author.
- Lex. & Lal.** *J. Lexarza and P. La Llave.* Authors of Descriptions novarum Vegetabilium. 2 fasc. 8vo. Mexico, 1824-5.
- Libosch.** *D. Liboschutz.* A foreign botanist.
- Loud.** See *Loudon.*
- Low.** *Hugh Low.* Nurseryman, Clapton.
- Lowe.** *Rev. R. T. Lowe.* Travelling bachelor of the University of Cambridge.
- Mack.** *J. T. Mackay, A.L.S., &c.* Author of Flora Hibernica.
- Mak.** *M. Jacob Makoy.* Nurseryman, Liège, Belgium.
- Mal.** *Malcolm, W., F.L.S., &c.* Late nurseryman at Kensington.
- Marn.** *Robert Marnock.* Curator of the Sheffield Botanic Garden.
- Mast.** *W. Masters, F.H.S.,* of the Canterbury Nursery, and Curator of the Canterbury Museum.
- Matth.** *Patrick Matthew.* A writer on Naval Timber, &c.
- Maur.** *Ernest Mauri.* A botanical author.
- M. B.** See *Bieb.*
- Maund.** *B. Maund, F.L.S., &c.* Conductor of the Botanic Garden, the Botanist, &c.
- Mer.** *X. V. Merat.* Author of Nouvelle Flore des Environs de Paris.
- Miel.** *Mitlichoffen.* A German botanist.
- Mœnch Supp.** *Mœnch's Supplementum ad Methodum, &c.*
- Moon Cat.** *Moon's Catalogue.*
- Morr.** *Morren.* Professor of botany at Liège.
- Müll.** *Müller.* A botanical author.
- Mx. fil.** *Michaux the Younger.* Author of Histoire des Arbres de l'Amérique.
- Neill.** *Dr. Neill, F.R.S.E., F.L.S., &c.,* of Canon Mills Cottage. A zealous botanist and promoter of horticulture.
- Opix.** *Opix.* A German botanist.
- P.** See *Ph.*
- Park.** *John Parkinson.* Author of Theatrum Botanicum. fol. 1640.
- Parker, ms.** *C. Parker, Esq.,* of Demerara.
- Paxt.** *Joseph Paxton, F.L.S., H.S., &c.* Editor of the Magazine of Botany, and gardener to His Grace the Duke of Devonshire, at Chatsworth.
- Perrot.** *Perrotet.* A French Botanist.
- Pf.** *Dr. Pfeiffer,* of Cassel, a writer in Garten Zeitung.
- Poc.** *Pococke.* A traveller in the East.
- Pr. C.** *Prince's* (of New York) *Nursery Catalogue.*
- Pucr.** *Pucrav.* A professor at Copenhagen.
- R. Cun.** *R. Cunningham, A.L.S., &c.* The late botanical collector, in Australia, for Kew Gardens.
- Rochler.** *Rochler.* Author of a Catalogue of Garden Plants.
- Robil.** *Robillard.* A French botanist.
- Ron.** *Ronalds.* A nurseryman at Brentford.
- Ross.** *Rosignol.* A French botanist.
- Royle.** *Dr. Royle, V.P.R.S., &c.,* Professor of Mat. Med. in King's College. Author of Illustrations of the Natural History of the Himalayas, &c.
- S. & C.** *Schlichtendahl and Chamisso.* German botanists.
- S. & D.** *Schiede and Deppe.* Writers on the botany of Mexico.
- S. & E.** *Schott,* a traveller in Brazil, and *Endlicher.*
- Sch. fil.** *Schultes fils.* A Bavarian botanist.
- Shaw.** *T. Shaw.* Author of Travels or Observations relating to several parts of Barbary and the Levant.
- Sieboldt.** *Dr. Von Sieboldt.* A Bavarian botanist.
- Sm. Ayr.** *Smith.* Nurseryman of Ayr.
- Spach.** A writer in the Annales des Sciences Naturelles.
- Str.** *Hon. W. F. Strangways.* A learned investigator of the flora of Europe.
- T. & B.** *Turner and Borrer,* English cryptogamic botanists.
- Tausch.** *Tausch.* A German botanist.
- Tongue.** *R. Tongue,* of Forton Cottage, Lancaster.
- Turcz.** *Turczaninow,* a traveller in Siberia.
- Traüt.** *Ern. Rud. a Traütvetter.* Attached to the Botanic Garden of Petersburg.
- Tayl.** *Dr. Taylor, F.L.S., &c.* An eminent cryptogamic botanist.
- Trew.** *C. J. Trew.* A botanical author.
- Vahl.** *Vahl.* A botanical author.
- Vis.** *Dr. Visiani.* A writer on the Flora of Dalmatia.
- W. & M.** *Weber and Mohr.* German cryptogamists.
- Wall. & Royle.** See *Wall.,* and also *Royle.*
- Wand.** *Wanderyoh.*
- Westc.** *Westcott.* One of the conductors of the Floral Cabinet.
- [W. H. B.]** *W. H. Baxter, jun.,* of the Oxford Botanic Garden.
- Wils.** *Wilson.* A cryptogamic botanist.
- Youell.** *Youell.* A nurseryman at Yarmouth, Norfolk.
- Zuccar.** See *Zuccarini.*

SECOND  
ADDITIONAL SUPPLEMENT

TO  
LOUDON'S  
HORTUS BRITANNICUS.

\* \* A † prefixed to genera indicates that they have been already registered, but here rearranged according to the latest authorities; prefixed to species, it denotes that they also have been previously registered, but with less perfect details.

In page 608., No. 29407. will be found without a species following it; and this occurs in a few other instances. In revising the work after it had been stereotyped, some species were discovered which had already appeared; in these cases the name has been deleted and the number left, to prevent a break in the series.

I.

PLANTS WITH CONSPICUOUS FLOWERS.

| Systematic Name and Authority.                                           | English Name.                                                                                              | Habit. Vars. 2 coccineum and 3 intermedium differ so very little from this species as hardly to be worth cultivation as distinct. The leaves of *A. r. coccineum* are somewhat redder in spring, when they expand, than those of *A. rübrüm*.

7992 aúlica, Hippeástrum aúlicum *Herb.*, Fl. cab. 52., "seems liable to much variation. We [Dr. Hooker] have represented a splendid variety in *Bot. Mag.* t. 2983., with green lines in the centre, running nearly the whole length of each petal; with a very obsolete glandular disk; and with long narrow glaucous leaves. Between this variety, and the variety platypétala *Lindley* in *Bot. Reg.* t. 1038., and the original A. aúlica *Ker* in *Bot. Reg.* t. 444., our present plant [figured in the *Bot. Mag.* for April, 1834, t. 3311.] seems intermediate. The points in which our plant differs from the A. aúlica *Ker* are, the petals are less sharply acuminate, and the base of the petals is of a darker green. The bulb was presented to the Glasgow Botanic Garden by — Pearson, Esq.; who had brought it from the neighbourhood of Rio Janeiro, in Brazil, where it is a native." (*Bot. Mag.* April.) A. aúlica itself, and all varieties of it, are, when in flower, superb plants.

29426 7956a kermesina *Booth* carmine-perian.  $\text{♀} \square$  or 1 ... Car Brazil 1833. O l.p.s. Bot reg. 1638  
It appears to rank next to A. advena *Bot. Reg.* t. 1125. fig. 1., and A. intermedia *Bot. Reg.* t. 1148.; but is perfectly distinct from both, and, indeed, from any species with which we are acquainted.—*W. B. Booth.*
